

NAME

CMS_add1_recipient, CMS_add1_recipient_cert, CMS_add0_recipient_key - add recipients to a CMS enveloped data structure

SYNOPSIS

```
#include <openssl/cms.h>
```

```
CMS_RecipientInfo *CMS_add1_recipient(CMS_ContentInfo *cms, X509 *recip,  
                                     EVP_PKEY *originatorPrivKey,  
                                     X509 *originator, unsigned int flags);
```

```
CMS_RecipientInfo *CMS_add1_recipient_cert(CMS_ContentInfo *cms,  
                                           X509 *recip, unsigned int flags);
```

```
CMS_RecipientInfo *CMS_add0_recipient_key(CMS_ContentInfo *cms, int nid,  
                                          unsigned char *key, size_t keylen,  
                                          unsigned char *id, size_t idlen,  
                                          ASN1_GENERALIZEDTIME *date,  
                                          ASN1_OBJECT *otherTypeId,  
                                          ASN1_TYPE *otherType);
```

DESCRIPTION

CMS_add1_recipient() adds recipient **recip** and provides the originator pkey **originatorPrivKey** and originator certificate **originator** to CMS_ContentInfo. The originator-related fields are relevant only in case when the keyAgreement method of providing of the shared key is in use.

CMS_add1_recipient_cert() adds recipient **recip** to CMS_ContentInfo enveloped data structure **cms** as a KeyTransRecipientInfo structure.

CMS_add0_recipient_key() adds symmetric key **key** of length **keylen** using wrapping algorithm **nid**, identifier **id** of length **idlen** and optional values **date**, **otherTypeId** and **otherType** to CMS_ContentInfo enveloped data structure **cms** as a KEKRecipientInfo structure.

The CMS_ContentInfo structure should be obtained from an initial call to **CMS_encrypt()** with the flag **CMS_PARTIAL** set.

NOTES

The main purpose of this function is to provide finer control over a CMS enveloped data structure where the simpler **CMS_encrypt()** function defaults are not appropriate. For example if one or more KEKRecipientInfo structures need to be added. New attributes can also be added using the returned

CMS_RecipientInfo structure and the CMS attribute utility functions.

OpenSSL will by default identify recipient certificates using issuer name and serial number. If **CMS_USE_KEYID** is set it will use the subject key identifier value instead. An error occurs if all recipient certificates do not have a subject key identifier extension.

Currently only AES based key wrapping algorithms are supported for **nid**, specifically: NID_id_aes128_wrap, NID_id_aes192_wrap and NID_id_aes256_wrap. If **nid** is set to **NID_undef** then an AES wrap algorithm will be used consistent with **keylen**.

RETURN VALUES

CMS_add1_recipient_cert() and **CMS_add0_recipient_key()** return an internal pointer to the CMS_RecipientInfo structure just added or NULL if an error occurs.
