

NAME

DH_generate_parameters_ex, DH_generate_parameters, DH_check, DH_check_params, DH_check_ex, DH_check_params_ex, DH_check_pub_key_ex - generate and check Diffie-Hellman parameters

SYNOPSIS

```
#include <openssl/dh.h>
```

The following functions have been deprecated since OpenSSL 3.0, and can be hidden entirely by defining **OPENSSL_API_COMPAT** with a suitable version value, see **openssl_user_macros(7)**:

```
int DH_generate_parameters_ex(DH *dh, int prime_len, int generator, BN_GENCB *cb);
```

```
int DH_check(DH *dh, int *codes);
```

```
int DH_check_params(DH *dh, int *codes);
```

```
int DH_check_ex(const DH *dh);
```

```
int DH_check_params_ex(const DH *dh);
```

```
int DH_check_pub_key_ex(const DH *dh, const BIGNUM *pub_key);
```

The following functions have been deprecated since OpenSSL 0.9.8, and can be hidden entirely by defining **OPENSSL_API_COMPAT** with a suitable version value, see **openssl_user_macros(7)**:

```
DH *DH_generate_parameters(int prime_len, int generator,  
                           void (*callback)(int, int, void *), void *cb_arg);
```

DESCRIPTION

All of the functions described on this page are deprecated. Applications should instead use **EVP_PKEY_check(3)**, **EVP_PKEY_public_check(3)**, **EVP_PKEY_private_check(3)** and **EVP_PKEY_param_check(3)**.

DH_generate_parameters_ex() generates Diffie-Hellman parameters that can be shared among a group of users, and stores them in the provided **DH** structure. The pseudo-random number generator must be seeded before calling it. The parameters generated by **DH_generate_parameters_ex()** should not be used in signature schemes.

prime_len is the length in bits of the safe prime to be generated. **generator** is a small number > 1, typically 2 or 5.

A callback function may be used to provide feedback about the progress of the key generation. If **cb** is

not **NULL**, it will be called as described in **BN_generate_prime(3)** while a random prime number is generated, and when a prime has been found, **BN_GENCB_call(cb, 3, 0)** is called. See **BN_generate_prime_ex(3)** for information on the **BN_GENCB_call()** function.

DH_generate_parameters() is similar to **DH_generate_prime_ex()** but expects an old-style callback function; see **BN_generate_prime(3)** for information on the old-style callback.

DH_check_params() confirms that the **p** and **g** are likely enough to be valid. This is a lightweight check, if a more thorough check is needed, use **DH_check()**. The value of ***codes** is updated with any problems found. If ***codes** is zero then no problems were found, otherwise the following bits may be set:

DH_CHECK_P_NOT_PRIME

The parameter **p** has been determined to not being an odd prime. Note that the lack of this bit doesn't guarantee that **p** is a prime.

DH_NOT_SUITABLE_GENERATOR

The generator **g** is not suitable. Note that the lack of this bit doesn't guarantee that **g** is suitable, unless **p** is known to be a strong prime.

DH_MODULUS_TOO_SMALL

The modulus is too small.

DH_MODULUS_TOO_LARGE

The modulus is too large.

DH_check() confirms that the Diffie-Hellman parameters **dh** are valid. The value of ***codes** is updated with any problems found. If ***codes** is zero then no problems were found, otherwise the following bits may be set:

DH_CHECK_P_NOT_PRIME

The parameter **p** is not prime.

DH_CHECK_P_NOT_SAFE_PRIME

The parameter **p** is not a safe prime and no **q** value is present.

DH_UNABLE_TO_CHECK_GENERATOR

The generator **g** cannot be checked for suitability.

DH_NOT_SUITABLE_GENERATOR

The generator **g** is not suitable.

DH_CHECK_Q_NOT_PRIME

The parameter **q** is not prime.

DH_CHECK_INVALID_Q_VALUE

The parameter **q** is invalid.

DH_CHECK_INVALID_J_VALUE

The parameter **j** is invalid.

DH_check_ex(), **DH_check_params()** and **DH_check_pub_key_ex()** are similar to **DH_check()** and **DH_check_params()** respectively, but the error reasons are added to the thread's error queue instead of provided as return values from the function.

RETURN VALUES

DH_generate_parameters_ex(), **DH_check()** and **DH_check_params()** return 1 if the check could be performed, 0 otherwise.

DH_generate_parameters() returns a pointer to the DH structure or NULL if the parameter generation fails.

DH_check_ex(), **DH_check_params()** and **DH_check_pub_key_ex()** return 1 if the check is successful, 0 for failed.

The error codes can be obtained by **ERR_get_error(3)**.

SEE ALSO

DH_new(3), **ERR_get_error(3)**, **RAND_bytes(3)**, **DH_free(3)**

HISTORY

All of these functions were deprecated in OpenSSL 3.0.

DH_generate_parameters() was deprecated in OpenSSL 0.9.8; use **DH_generate_parameters_ex()** instead.
