

NAME

DSA_do_sign, DSA_do_verify - raw DSA signature operations

SYNOPSIS

```
#include <openssl/dsa.h>
```

The following functions have been deprecated since OpenSSL 3.0, and can be hidden entirely by defining **OPENSSL_API_COMPAT** with a suitable version value, see **openssl_user_macros(7)**:

```
DSA_SIG *DSA_do_sign(const unsigned char *dgst, int dlen, DSA *dsa);
```

```
int DSA_do_verify(const unsigned char *dgst, int dgst_len,  
                 DSA_SIG *sig, DSA *dsa);
```

DESCRIPTION

All of the functions described on this page are deprecated. Applications should instead use **EVP_PKEY_sign_init(3)**, **EVP_PKEY_sign(3)**, **EVP_PKEY_verify_init(3)** and **EVP_PKEY_verify(3)**.

DSA_do_sign() computes a digital signature on the **len** byte message digest **dgst** using the private key **dsa** and returns it in a newly allocated **DSA_SIG** structure.

DSA_sign_setup(3) may be used to precompute part of the signing operation in case signature generation is time-critical.

DSA_do_verify() verifies that the signature **sig** matches a given message digest **dgst** of size **len**. **dsa** is the signer's public key.

RETURN VALUES

DSA_do_sign() returns the signature, NULL on error. **DSA_do_verify()** returns 1 for a valid signature, 0 for an incorrect signature and -1 on error. The error codes can be obtained by **ERR_get_error(3)**.

SEE ALSO

DSA_new(3), **ERR_get_error(3)**, **RAND_bytes(3)**, **DSA_SIG_new(3)**, **DSA_sign(3)**

HISTORY

All of these functions were deprecated in OpenSSL 3.0.
