 EVP_CIPHER methods

SYNOPSIS

```
#include <openssl/evp.h>
```

The following functions have been deprecated since OpenSSL 3.0, and can be hidden entirely by defining **OPENSSL_API_COMPAT** with a suitable version value, see **openssl_user_macros(7)**:

```
EVP_CIPHER *EVP_CIPHER_meth_new(int cipher_type, int block_size, int key_len);
EVP_CIPHER *EVP_CIPHER_meth_dup(const EVP_CIPHER *cipher);
void EVP_CIPHER_meth_free(EVP_CIPHER *cipher);
```

```
int EVP_CIPHER_meth_set_iv_length(EVP_CIPHER *cipher, int iv_len);
int EVP_CIPHER_meth_set_flags(EVP_CIPHER *cipher, unsigned long flags);
int EVP_CIPHER_meth_set_impl_ctx_size(EVP_CIPHER *cipher, int ctx_size);
int EVP_CIPHER_meth_set_init(EVP_CIPHER *cipher,
    int (*init)(EVP_CIPHER_CTX *ctx,
        const unsigned char *key,
        const unsigned char *iv,
        int enc));
```

```
int EVP_CIPHER_meth_set_do_cipher(EVP_CIPHER *cipher,
    int (*do_cipher)(EVP_CIPHER_CTX *ctx,
        unsigned char *out,
        const unsigned char *in,
        size_t inl));
```

```
int EVP_CIPHER_meth_set_cleanup(EVP_CIPHER *cipher,
    int (*cleanup)(EVP_CIPHER_CTX *));
```

```
int EVP_CIPHER_meth_set_set_asn1_params(EVP_CIPHER *cipher,
    int (*set_asn1_parameters)(EVP_CIPHER_CTX *,
        ASN1_TYPE *));
```

```
int EVP_CIPHER_meth_set_get_asn1_params(EVP_CIPHER *cipher,
```

```

        int (*get_asn1_parameters)(EVP_CIPHER_CTX *,
                                   ASN1_TYPE *);
int EVP_CIPHER_meth_set_ctrl(EVP_CIPHER *cipher,
                             int (*ctrl)(EVP_CIPHER_CTX *, int type,
                                           int arg, void *ptr));

int (*EVP_CIPHER_meth_get_init(const EVP_CIPHER *cipher))(EVP_CIPHER_CTX *ctx,
                                                           const unsigned char *key,
                                                           const unsigned char *iv,
                                                           int enc);
int (*EVP_CIPHER_meth_get_do_cipher(const EVP_CIPHER *cipher))(EVP_CIPHER_CTX *ctx,
                                                                unsigned char *out,
                                                                const unsigned char *in,
                                                                size_t inl);
int (*EVP_CIPHER_meth_get_cleanup(const EVP_CIPHER *cipher))(EVP_CIPHER_CTX *);
int (*EVP_CIPHER_meth_get_set_asn1_params(const EVP_CIPHER *cipher))(EVP_CIPHER_CTX *,
                                                                      ASN1_TYPE *);
int (*EVP_CIPHER_meth_get_get_asn1_params(const EVP_CIPHER *cipher))(EVP_CIPHER_CTX *,
                                                                      ASN1_TYPE *);
int (*EVP_CIPHER_meth_get_ctrl(const EVP_CIPHER *cipher))(EVP_CIPHER_CTX *,
                                                           int type, int arg,
                                                           void *ptr);

```

DESCRIPTION

All of the functions described on this page are deprecated. Applications should instead use the OSSL_PROVIDER APIs.

The **EVP_CIPHER** type is a structure for symmetric cipher method implementation.

EVP_CIPHER_meth_new() creates a new **EVP_CIPHER** structure.

EVP_CIPHER_meth_dup() creates a copy of **cipher**.

EVP_CIPHER_meth_free() destroys a **EVP_CIPHER** structure.

EVP_CIPHER_meth_set_iv_length() sets the length of the IV. This is only needed when the implemented cipher mode requires it.

EVP_CIPHER_meth_set_flags() sets the flags to describe optional behaviours in the particular **cipher**. With the exception of cipher modes, of which only one may be present, several flags can be or'd

together. The available flags are:

EVP_CIPH_STREAM_CIPHER, EVP_CIPH_ECB_MODE, EVP_CIPH_CBC_MODE,
EVP_CIPH_CFB_MODE, EVP_CIPH_OFB_MODE, EVP_CIPH_CTR_MODE,
EVP_CIPH_GCM_MODE, EVP_CIPH_CCM_MODE, EVP_CIPH_XTS_MODE,
EVP_CIPH_WRAP_MODE, EVP_CIPH_OCB_MODE, EVP_CIPH_SIV_MODE

The cipher mode.

EVP_CIPH_VARIABLE_LENGTH

This cipher is of variable length.

EVP_CIPH_CUSTOM_IV

Storing and initialising the IV is left entirely to the implementation.

EVP_CIPH_ALWAYS_CALL_INIT

Set this if the implementation's **init()** function should be called even if **key** is **NULL**.

EVP_CIPH_CTRL_INIT

Set this to have the implementation's **ctrl()** function called with command code **EVP_CTRL_INIT** early in its setup.

EVP_CIPH_CUSTOM_KEY_LENGTH

Checking and setting the key length after creating the **EVP_CIPHER** is left to the implementation. Whenever someone uses **EVP_CIPHER_CTX_set_key_length()** on a **EVP_CIPHER** with this flag set, the implementation's **ctrl()** function will be called with the control code **EVP_CTRL_SET_KEY_LENGTH** and the key length in **arg**.

EVP_CIPH_NO_PADDING

Don't use standard block padding.

EVP_CIPH_RAND_KEY

Making a key with random content is left to the implementation. This is done by calling the implementation's **ctrl()** function with the control code **EVP_CTRL_RAND_KEY** and the pointer to the key memory storage in **ptr**.

EVP_CIPH_CUSTOM_COPY

Set this to have the implementation's **ctrl()** function called with command code **EVP_CTRL_COPY** at the end of **EVP_CIPHER_CTX_copy()**. The intended use is for further things to deal with after the implementation specific data block has been copied. The destination **EVP_CIPHER_CTX** is passed to the control with the **ptr** parameter. The implementation specific

data block is reached with **EVP_CIPHER_CTX_get_cipher_data()**.

EVP_CIPH_FLAG_DEFAULT_ASN1

Use the default EVP routines to pass IV to and from ASN.1.

EVP_CIPH_FLAG_LENGTH_BITS

Signals that the length of the input buffer for encryption / decryption is to be understood as the number of bits instead of bytes for this implementation. This is only useful for CFB1 ciphers.

EVP_CIPH_FLAG_CTS

Indicates that the cipher uses ciphertext stealing. This is currently used to indicate that the cipher is a one shot that only allows a single call to **EVP_CipherUpdate()**.

EVP_CIPH_FLAG_CUSTOM_CIPHER

This indicates that the implementation takes care of everything, including padding, buffering and finalization. The EVP routines will simply give them control and do nothing more.

EVP_CIPH_FLAG_AEAD_CIPHER

This indicates that this is an AEAD cipher implementation.

EVP_CIPH_FLAG_TLS1_1_MULTIBLOCK

Allow interleaving of crypto blocks, a particular optimization only applicable to certain TLS ciphers.

EVP_CIPHER_meth_set_impl_ctx_size() sets the size of the EVP_CIPHER's implementation context so that it can be automatically allocated.

EVP_CIPHER_meth_set_init() sets the cipher init function for **cipher**. The cipher init function is called by **EVP_CipherInit()**, **EVP_CipherInit_ex()**, **EVP_EncryptInit()**, **EVP_EncryptInit_ex()**, **EVP_DecryptInit()**, **EVP_DecryptInit_ex()**.

EVP_CIPHER_meth_set_do_cipher() sets the cipher function for **cipher**. The cipher function is called by **EVP_CipherUpdate()**, **EVP_EncryptUpdate()**, **EVP_DecryptUpdate()**, **EVP_CipherFinal()**, **EVP_EncryptFinal()**, **EVP_EncryptFinal_ex()**, **EVP_DecryptFinal()** and **EVP_DecryptFinal_ex()**.

EVP_CIPHER_meth_set_cleanup() sets the function for **cipher** to do extra cleanup before the method's private data structure is cleaned out and freed. Note that the cleanup function is passed a **EVP_CIPHER_CTX ***, the private data structure is then available with **EVP_CIPHER_CTX_get_cipher_data()**. This cleanup function is called by **EVP_CIPHER_CTX_reset()** and **EVP_CIPHER_CTX_free()**.

EVP_CIPHER_meth_set_set_asn1_params() sets the function for **cipher** to set the AlgorithmIdentifier "parameter" based on the passed cipher. This function is called by **EVP_CIPHER_param_to_asn1()**. **EVP_CIPHER_meth_set_get_asn1_params()** sets the function for **cipher** that sets the cipher parameters based on an ASN.1 AlgorithmIdentifier "parameter". Both these functions are needed when there is a need for custom data (more or other than the cipher IV). They are called by **EVP_CIPHER_param_to_asn1()** and **EVP_CIPHER_asn1_to_param()** respectively if defined.

EVP_CIPHER_meth_set_ctrl() sets the control function for **cipher**.

EVP_CIPHER_meth_get_init(), **EVP_CIPHER_meth_get_do_cipher()**, **EVP_CIPHER_meth_get_cleanup()**, **EVP_CIPHER_meth_get_set_asn1_params()**, **EVP_CIPHER_meth_get_get_asn1_params()** and **EVP_CIPHER_meth_get_ctrl()** are all used to retrieve the method data given with the **EVP_CIPHER_meth_set_***() functions above.

RETURN VALUES

EVP_CIPHER_meth_new() and **EVP_CIPHER_meth_dup()** return a pointer to a newly created **EVP_CIPHER**, or NULL on failure. All **EVP_CIPHER_meth_set_***() functions return 1. All **EVP_CIPHER_meth_get_***() functions return pointers to their respective **cipher** function.

SEE ALSO

EVP_EncryptInit(3)

HISTORY

All of these functions were deprecated in OpenSSL 3.0.

The functions described here were added in OpenSSL 1.1.0. The **EVP_CIPHER** structure created with these functions became reference counted in OpenSSL 3.0.
