

NAME

EVP_KEYEXCH_fetch, EVP_KEYEXCH_free, EVP_KEYEXCH_up_ref,
 EVP_KEYEXCH_get0_provider, EVP_KEYEXCH_is_a, EVP_KEYEXCH_do_all_provided,
 EVP_KEYEXCH_names_do_all, EVP_KEYEXCH_get0_name, EVP_KEYEXCH_get0_description,
 EVP_KEYEXCH_gettable_ctx_params, EVP_KEYEXCH_settable_ctx_params - Functions to manage
 EVP_KEYEXCH algorithm objects

SYNOPSIS

```
#include <openssl/evp.h>
```

```
EVP_KEYEXCH *EVP_KEYEXCH_fetch(OSSL_LIB_CTX *ctx, const char *algorithm,
                                const char *properties);
void EVP_KEYEXCH_free(EVP_KEYEXCH *exchange);
int EVP_KEYEXCH_up_ref(EVP_KEYEXCH *exchange);
OSSL_PROVIDER *EVP_KEYEXCH_get0_provider(const EVP_KEYEXCH *exchange);
int EVP_KEYEXCH_is_a(const EVP_KEYEXCH *exchange, const char *name);
const char *EVP_KEYEXCH_get0_name(const EVP_KEYEXCH *exchange);
void EVP_KEYEXCH_do_all_provided(OSSL_LIB_CTX *libctx,
                                 void (*fn)(EVP_KEYEXCH *exchange, void *arg),
                                 void *arg);
int EVP_KEYEXCH_names_do_all(const EVP_KEYEXCH *exchange,
                             void (*fn)(const char *name, void *data),
                             void *data);
const char *EVP_KEYEXCH_get0_description(const EVP_KEYEXCH *keyexch);
const OSSL_PARAM *EVP_KEYEXCH_gettable_ctx_params(const EVP_KEYEXCH *keyexch);
const OSSL_PARAM *EVP_KEYEXCH_settable_ctx_params(const EVP_KEYEXCH *keyexch);
```

DESCRIPTION

EVP_KEYEXCH_fetch() fetches the key exchange implementation for the given *algorithm* from any provider offering it, within the criteria given by the *properties*. See "ALGORITHM FETCHING" in **crypto(7)** for further information.

The returned value must eventually be freed with **EVP_KEYEXCH_free()**.

EVP_KEYEXCH_free() decrements the reference count for the **EVP_KEYEXCH** structure. Typically this structure will have been obtained from an earlier call to **EVP_KEYEXCH_fetch()**. If the reference count drops to 0 then the structure is freed.

EVP_KEYEXCH_up_ref() increments the reference count for an **EVP_KEYEXCH** structure.

EVP_KEYEXCH_get0_provider() returns the provider that *exchange* was fetched from.

EVP_KEYEXCH_is_a() checks if *exchange* is an implementation of an algorithm that's identifiable with *name*.

EVP_KEYEXCH_get0_name() returns the algorithm name from the provided implementation for the given *exchange*. Note that the *exchange* may have multiple synonyms associated with it. In this case the first name from the algorithm definition is returned. Ownership of the returned string is retained by the *exchange* object and should not be freed by the caller.

EVP_KEYEXCH_names_do_all() traverses all names for the *exchange*, and calls *fn* with each name and *data*.

EVP_KEYEXCH_get0_description() returns a description of the *keyexch*, meant for display and human consumption. The description is at the discretion of the *keyexch* implementation.

EVP_KEYEXCH_do_all_provided() traverses all key exchange implementations by all activated providers in the library context *libctx*, and for each of the implementations, calls *fn* with the implementation method and *data* as arguments.

EVP_KEYEXCH_gettable_ctx_params() and **EVP_KEYEXCH_settable_ctx_params()** return a constant **OSSL_PARAM(3)** array that describes the names and types of key parameters that can be retrieved or set by a key exchange algorithm using **EVP_PKEY_CTX_get_params(3)** and **EVP_PKEY_CTX_set_params(3)**.

RETURN VALUES

EVP_KEYEXCH_fetch() returns a pointer to a **EVP_KEYEXCH** for success or NULL for failure.

EVP_KEYEXCH_up_ref() returns 1 for success or 0 otherwise.

EVP_KEYEXCH_names_do_all() returns 1 if the callback was called for all names. A return value of 0 means that the callback was not called for any names.

EVP_KEYEXCH_is_a() returns 1 if *exchange* was identifiable, otherwise 0.

EVP_KEYEXCH_gettable_ctx_params() and **EVP_KEYEXCH_settable_ctx_params()** return a constant **OSSL_PARAM(3)** array or NULL on error.
