

NAME

EVP_VerifyInit_ex, EVP_VerifyInit, EVP_VerifyUpdate, EVP_VerifyFinal_ex, EVP_VerifyFinal -
EVP signature verification functions

SYNOPSIS

```
#include <openssl/evp.h>
```

```
int EVP_VerifyInit_ex(EVP_MD_CTX *ctx, const EVP_MD *type, ENGINE *impl);  
int EVP_VerifyUpdate(EVP_MD_CTX *ctx, const void *d, unsigned int cnt);  
int EVP_VerifyFinal_ex(EVP_MD_CTX *ctx, const unsigned char *sigbuf,  
                      unsigned int siglen, EVP_PKEY *pkey,  
                      OSSL_LIB_CTX *libctx, const char *propq);  
int EVP_VerifyFinal(EVP_MD_CTX *ctx, unsigned char *sigbuf, unsigned int siglen,  
                   EVP_PKEY *pkey);
```

```
int EVP_VerifyInit(EVP_MD_CTX *ctx, const EVP_MD *type);
```

DESCRIPTION

The EVP signature verification routines are a high-level interface to digital signatures.

EVP_VerifyInit_ex() sets up verification context *ctx* to use digest *type* from ENGINE *impl*. *ctx* must be created by calling **EVP_MD_CTX_new()** before calling this function.

EVP_VerifyUpdate() hashes *cnt* bytes of data at *d* into the verification context *ctx*. This function can be called several times on the same *ctx* to include additional data.

EVP_VerifyFinal_ex() verifies the data in *ctx* using the public key *pkey* and *siglen* bytes in *sigbuf*. The library context *libctx* and property query *propq* are used when creating a context to use with the key *pkey*.

EVP_VerifyFinal() is similar to **EVP_VerifyFinal_ex()** but uses default values of NULL for the library context *libctx* and the property query *propq*.

EVP_VerifyInit() initializes verification context *ctx* to use the default implementation of digest *type*.

RETURN VALUES

EVP_VerifyInit_ex() and **EVP_VerifyUpdate()** return 1 for success and 0 for failure.

EVP_VerifyFinal_ex() and **EVP_VerifyFinal()** return 1 for a correct signature, 0 for failure and a negative value if some other error occurred.

The error codes can be obtained by **ERR_get_error(3)**.

NOTES

The **EVP** interface to digital signatures should almost always be used in preference to the low-level interfaces. This is because the code then becomes transparent to the algorithm used and much more flexible.

The call to **EVP_VerifyFinal()** internally finalizes a copy of the digest context. This means that calls to **EVP_VerifyUpdate()** and **EVP_VerifyFinal()** can be called later to digest and verify additional data.

Since only a copy of the digest context is ever finalized the context must be cleaned up after use by calling **EVP_MD_CTX_free()** or a memory leak will occur.

BUGS

Older versions of this documentation wrongly stated that calls to **EVP_VerifyUpdate()** could not be made after calling **EVP_VerifyFinal()**.

Since the public key is passed in the call to **EVP_SignFinal()** any error relating to the private key (for example an unsuitable key and digest combination) will not be indicated until after potentially large amounts of data have been passed through **EVP_SignUpdate()**.

It is not possible to change the signing parameters using these function.

The previous two bugs are fixed in the newer **EVP_DigestVerify*()** function.

HISTORY

The function **EVP_VerifyFinal_ex()** was added in OpenSSL 3.0.
