

NAME

MDC2, MDC2_Init, MDC2_Update, MDC2_Final - MDC2 hash function

SYNOPSIS

```
#include <openssl/mdc2.h>
```

The following functions have been deprecated since OpenSSL 3.0, and can be hidden entirely by defining **OPENSSL_API_COMPAT** with a suitable version value, see **openssl_user_macros(7)**:

```
unsigned char *MDC2(const unsigned char *d, unsigned long n,  
                    unsigned char *md);
```

```
int MDC2_Init(MDC2_CTX *c);
```

```
int MDC2_Update(MDC2_CTX *c, const unsigned char *data,  
               unsigned long len);
```

```
int MDC2_Final(unsigned char *md, MDC2_CTX *c);
```

DESCRIPTION

All of the functions described on this page are deprecated. Applications should instead use **EVP_DigestInit_ex(3)**, **EVP_DigestUpdate(3)** and **EVP_DigestFinal_ex(3)**.

MDC2 is a method to construct hash functions with 128 bit output from block ciphers. These functions are an implementation of MDC2 with DES.

MDC2() computes the MDC2 message digest of the **n** bytes at **d** and places it in **md** (which must have space for **MDC2_DIGEST_LENGTH == 16** bytes of output). If **md** is NULL, the digest is placed in a static array.

The following functions may be used if the message is not completely stored in memory:

MDC2_Init() initializes a **MDC2_CTX** structure.

MDC2_Update() can be called repeatedly with chunks of the message to be hashed (**len** bytes at **data**).

MDC2_Final() places the message digest in **md**, which must have space for **MDC2_DIGEST_LENGTH == 16** bytes of output, and erases the **MDC2_CTX**.

Applications should use the higher level functions **EVP_DigestInit(3)** etc. instead of calling the hash functions directly.

RETURN VALUES

MDC2() returns a pointer to the hash value.

MDC2_Init(), **MDC2_Update()** and **MDC2_Final()** return 1 for success, 0 otherwise.

CONFORMING TO

ISO/IEC 10118-2:2000 Hash-Function 2, with DES as the underlying block cipher.

SEE ALSO

EVP_DigestInit(3)

HISTORY

All of these functions were deprecated in OpenSSL 3.0.
