

## NAME

OSSL\_DECODER\_from\_data, OSSL\_DECODER\_from\_bio, OSSL\_DECODER\_from\_fp - Routines to perform a decoding

## SYNOPSIS

```
#include <openssl/decoder.h>
```

```
int OSSL_DECODER_from_bio(OSSL_DECODER_CTX *ctx, BIO *in);
int OSSL_DECODER_from_fp(OSSL_DECODER_CTX *ctx, FILE *fp);
int OSSL_DECODER_from_data(OSSL_DECODER_CTX *ctx, const unsigned char **pdata,
                           size_t *pdata_len);
```

Feature availability macros:

**OSSL\_DECODER\_from\_fp()** is only available when **OPENSSL\_NO\_STDIO** is undefined.

## DESCRIPTION

**OSSL\_DECODER\_from\_data()** runs the decoding process for the context *ctx*, with input coming from *\*pdata*, *\*pdata\_len* bytes long. Both *\*pdata* and *\*pdata\_len* must be non-NULL. When **OSSL\_DECODER\_from\_data()** returns, *\*pdata* is updated to point at the location after what has been decoded, and *\*pdata\_len* to have the number of remaining bytes.

**OSSL\_DECODER\_from\_bio()** runs the decoding process for the context *ctx*, with the input coming from the **BIO** *in*. Should it make a difference, it's recommended to have the BIO set in binary mode rather than text mode.

**OSSL\_DECODER\_from\_fp()** does the same thing as **OSSL\_DECODER\_from\_bio()**, except that the input is coming from the **FILE** *fp*.

## RETURN VALUES

**OSSL\_DECODER\_from\_bio()**, **OSSL\_DECODER\_from\_data()** and **OSSL\_DECODER\_from\_fp()** return 1 on success, or 0 on failure.

## EXAMPLES

To decode an RSA key encoded with PEM from a bio:

```
OSSL_DECODER_CTX *dctx;
EVP_PKEY *pkey = NULL;
const char *format = "PEM"; /* NULL for any format */
const char *structure = NULL; /* any structure */
```

```

const char *keytype = "RSA"; /* NULL for any key */
const unsigned char *pass = "my password";

dctx = OSSL_DECODER_CTX_new_for_pkey(&pkey, format, structure,
                                     keytype,
                                     OSSL_KEYMGMT_SELECT_KEYPAIR,
                                     NULL, NULL);
if (dctx == NULL) {
    /* error: no suitable potential decoders found */
}
if (pass != NULL)
    OSSL_DECODER_CTX_set_passphrase(dctx, pass, strlen(pass));
if (OSSL_DECODER_from_bio(dctx, bio)) {
    /* pkey is created with the decoded data from the bio */
} else {
    /* decoding failure */
}
OSSL_DECODER_CTX_free(dctx);

```

To decode an EC key encoded with DER from a buffer:

```

OSSL_DECODER_CTX *dctx;
EVP_PKEY *pkey = NULL;
const char *format = "DER"; /* NULL for any format */
const char *structure = NULL; /* any structure */
const char *keytype = "EC"; /* NULL for any key */
const unsigned char *pass = NULL;
const unsigned char *data = buffer;
size_t datalen = sizeof(buffer);

dctx = OSSL_DECODER_CTX_new_for_pkey(&pkey, format, structure,
                                     keytype,
                                     OSSL_KEYMGMT_SELECT_KEYPAIR
                                     | OSSL_KEYMGMT_SELECT_DOMAIN_PARAMETERS,
                                     NULL, NULL);
if (dctx == NULL) {
    /* error: no suitable potential decoders found */
}
if (pass != NULL)
    OSSL_DECODER_CTX_set_passphrase(dctx, pass, strlen(pass));

```

```
if (OSSL_DECODER_from_data(dctx, &data, &datalen)) {
    /* pkey is created with the decoded data from the buffer */
} else {
    /* decoding failure */
}
OSSL_DECODER_CTX_free(dctx);
```
