

NAME

PKCS12_SAFEBAG_create_cert, PKCS12_SAFEBAG_create_crl,
 PKCS12_SAFEBAG_create_secret, PKCS12_SAFEBAG_create0_p8inf,
 PKCS12_SAFEBAG_create0_pkcs8, PKCS12_SAFEBAG_create_pkcs8_encrypt,
 PKCS12_SAFEBAG_create_pkcs8_encrypt_ex - Create PKCS#12 safeBag objects

SYNOPSIS

```
#include <openssl/pkcs12.h>
```

```
PKCS12_SAFEBAG *PKCS12_SAFEBAG_create_cert(X509 *x509);
PKCS12_SAFEBAG *PKCS12_SAFEBAG_create_crl(X509_CRL *crl);
PKCS12_SAFEBAG *PKCS12_SAFEBAG_create_secret(int type, int vtype,
        const unsigned char* value,
        int len);
PKCS12_SAFEBAG *PKCS12_SAFEBAG_create0_p8inf(PKCS8_PRIV_KEY_INFO *p8);
PKCS12_SAFEBAG *PKCS12_SAFEBAG_create0_pkcs8(X509_SIG *p8);
PKCS12_SAFEBAG *PKCS12_SAFEBAG_create_pkcs8_encrypt(int pbe_nid,
        const char *pass,
        int passlen,
        unsigned char *salt,
        int saltlen, int iter,
        PKCS8_PRIV_KEY_INFO *p8inf);
PKCS12_SAFEBAG *PKCS12_SAFEBAG_create_pkcs8_encrypt_ex(int pbe_nid,
        const char *pass,
        int passlen,
        unsigned char *salt,
        int saltlen, int iter,
        PKCS8_PRIV_KEY_INFO *p8inf,
        OSSL_LIB_CTX *ctx,
        const char *propq);
```

DESCRIPTION

PKCS12_SAFEBAG_create_cert() creates a new **PKCS12_SAFEBAG** of type **NID_certBag** containing the supplied certificate.

PKCS12_SAFEBAG_create_crl() creates a new **PKCS12_SAFEBAG** of type **NID_crlBag** containing the supplied crl.

PKCS12_SAFEBAG_create_secret() creates a new **PKCS12_SAFEBAG** of type corresponding to a PKCS#12 **secretBag**. The **secretBag** contents are tagged as *type* with an ASN1 value of type *vtype*

constructed using the bytes in *value* of length *len*.

PKCS12_SAFEABAG_create0_p8inf() creates a new **PKCS12_SAFEABAG** of type **NID_keyBag** containing the supplied PKCS8 structure.

PKCS12_SAFEABAG_create0_pkcs8() creates a new **PKCS12_SAFEABAG** of type **NID_pkcs8ShroudedKeyBag** containing the supplied PKCS8 structure.

PKCS12_SAFEABAG_create_pkcs8_encrypt() creates a new **PKCS12_SAFEABAG** of type **NID_pkcs8ShroudedKeyBag** by encrypting the supplied PKCS8 *p8inf*. If *pbe_nid* is 0, a default encryption algorithm is used. *pass* is the passphrase and *iter* is the iteration count. If *iter* is zero then a default value of 2048 is used. If *salt* is NULL then a salt is generated randomly.

PKCS12_SAFEABAG_create_pkcs8_encrypt_ex() is identical to **PKCS12_SAFEABAG_create_pkcs8_encrypt()** but allows for a library context *ctx* and property query *propq* to be used to select algorithm implementations.

NOTES

PKCS12_SAFEABAG_create_pkcs8_encrypt() makes assumptions regarding the encoding of the given pass phrase. See **passphrase-encoding(7)** for more information.

PKCS12_SAFEABAG_create_secret() was added in OpenSSL 3.0.

RETURN VALUES

All of these functions return a valid **PKCS12_SAFEABAG** structure or NULL if an error occurred.

CONFORMING TO

IETF RFC 7292 (<<https://tools.ietf.org/html/rfc7292>>)
