#include <openssl/pkcs7.h>

NAME

SMIME read PKCS7 ex, SMIME read PKCS7 - parse S/MIME message

SYNOPSIS

```
PKCS7 *SMIME_read_PKCS7_ex(BIO *bio, BIO **bcont, PKCS7 **p7);
PKCS7 *SMIME read PKCS7(BIO *in, BIO **bcont);
```

DESCRIPTION

SMIME_read_PKCS7() parses a message in S/MIME format.

in is a BIO to read the message from.

If cleartext signing is used then the content is saved in a memory bio which is written to *bcont, otherwise *bcont is set to NULL.

The parsed PKCS#7 structure is returned or **NULL** if an error occurred.

SMIME_read_PKCS7_ex() is similar to **SMIME_read_PKCS7**() but can optionally supply a previously created *p7* PKCS#7 object. If *p7* is NULL then it is identical to **SMIME_read_PKCS7**(). To create a *p7* object use **PKCS7_new_ex**(3).

NOTES

If *bcont is not NULL then the message is clear text signed. *bcont can then be passed to PKCS7_verify() with the PKCS7_DETACHED flag set.

Otherwise the type of the returned structure can be determined using **PKCS7_type_is_enveloped()**, etc.

To support future functionality if **bcont** is not **NULL** ***bcont** should be initialized to **NULL**. For example:

```
BIO *cont = NULL;
PKCS7 *p7;
p7 = SMIME_read_PKCS7(in, &cont);
```

BUGS

The MIME parser used by **SMIME_read_PKCS7**() is somewhat primitive. While it will handle most S/MIME messages more complex compound formats may not work.

The parser assumes that the PKCS7 structure is always base64 encoded and will not handle the case where it is in binary format or uses quoted printable format.

The use of a memory BIO to hold the signed content limits the size of message which can be processed due to memory restraints: a streaming single pass option should be available.

RETURN VALUES

SMIME_read_PKCS7_ex() and SMIME_read_PKCS7() return a valid PKCS7 structure or NULL if an error occurred. The error can be obtained from ERR_get_error(3).

HISTORY

The function **SMIME_read_PKCS7_ex()** was added in OpenSSL 3.0.
