# NAME

SSL_get0_peer_scts - get SCTs received

# SYNOPSIS

 #include <openssl/ssl.h>

 const STACK_OF(SCT) *SSL_get0_peer_scts(SSL *s);

# DESCRIPTION

**SSL_get0_peer_scts()** returns the signed certificate timestamps (SCTs) that have been received. If this is the first time that this function has been called for a given **SSL** instance, it will examine the TLS extensions, OCSP response and the peer's certificate for SCTs. Future calls will return the same SCTs.

# RESTRICTIONS

If no Certificate Transparency validation callback has been set (using **SSL_CTX_set_ct_validation_callback** or **SSL_set_ct_validation_callback**), this function is not guaranteed to return all of the SCTs that the peer is capable of sending.

# RETURN VALUES

**SSL_get0_peer_scts()** returns a list of SCTs found, or NULL if an error occurs.

# SEE ALSO

**ssl**(7), **SSL_CTX_set_ct_validation_callback**(3)
