NAME

    XPutBackEvent - put events back on the queue

SYNTAX

    XPutBackEvent(Display *_display_, XEvent *_event_);

ARGUMENTS

    display   Specifies the connection to the X server.

    event   Specifies the event.

DESCRIPTION

    The **XPutBackEvent** function pushes an event back onto the head of the display's event queue by copying the event into the queue. This can be useful if you read an event and then decide that you would rather deal with it later. There is no limit to the number of times in succession that you can call **XPutBackEvent**.
