

NAME

XkbAllocGeomPoints - Allocate points in an outline

SYNOPSIS

Status XkbAllocGeomPoints (**XkbOutlinePtr** *outline*, **int** *num_needed*);

ARGUMENTS

outline

outline for which points should be allocated

num_needed

number of new points required

DESCRIPTION

Xkb provides a number of functions to allocate and free subcomponents of a keyboard geometry. Use these functions to create or modify keyboard geometries. Note that these functions merely allocate space for the new element(s), and it is up to you to fill in the values explicitly in your code. These allocation functions increase *sz_** but never touch *num_** (unless there is an allocation failure, in which case they reset both *sz_** and *num_** to zero). These functions return Success if they succeed, BadAlloc if they are not able to allocate space, or BadValue if a parameter is not as expected.

XkbAllocGeomPoints allocates space for *num_needed* points in the specified *outline*. The points are not initialized.

DIAGNOSTICS

BadAlloc Unable to allocate storage

BadValue An argument is out of range
