### **NAME**

XkbNoteControlsChanges - Notes the changes in a changes structure when a client receives an XkbControlsNotify event

### **SYNOPSIS**

void XkbNoteControlsChanges (XkbControlsChangesPtr changes, XkbControlsNotifyEvent \*new,
 unsigned int wanted);

# **ARGUMENTS**

changes
 records changes indicated by new

new
 tells which things have changed

wanted
 tells which parts of new to record in changes

# DESCRIPTION

Whenever a field in the controls structure changes in the server's keyboard description, the server sends an XkbControlsNotify event to all interested clients. To receive XkbControlsNotify events under all possible conditions, use XkbSelectEvents and pass XkbControlsNotifyMask in both bits\_to\_change and values\_for\_bits.

To receive XkbControlsNotify events only under certain conditions, use XkbSelectEventDetails using XkbControlsNotify as the *event\_type* and specifying the desired state changes in *bits\_to\_change* and *values\_for\_bits* using mask bits from Table 1.

Table 1 shows the actual values for the individual mask bits used to select controls for modification and to enable and disable the control. Note that the same mask bit is used to specify general modifications to the parameters used to configure the control (which), and to enable and disable the control (enabled\_ctrls). The anomalies in the table (no "ok" in column) are for controls that have no configurable attributes; and for controls that are not boolean controls and therefore cannot be enabled or disabled.

Bits		
Mask	which	enabledValue

Bit	or changed_ctrls_ctrls				
XkbRepeatKeysMask	ok	ok	(1L<<0)		
XkbSlowKeysMask	ok	ok	(1L<<1)		
XkbBounceKeysMask	ok	ok	(1L<<2)		
XkbStickyKeysMask	ok	ok	(1L<<3)		
XkbMouseKeysMask	ok	ok	(1L<<4)		
Xkb Mouse Keys Accel Mask	ok	ok	(1L<<5)		
XkbAccessXKeysMask	ok	ok	(1L<<6)		
XkbAccessXTime outMask	ok	ok	(1L<<7)		
XkbAccessXFeedbackMask	ok	ok	(1L<<8)		
XkbAudibleBellMask		ok	(1L<<9)		
XkbOverlay1Mask		ok	(1L<<10)		
XkbOverlay2Mask		ok	(1L<<11)		
XkbIgnoreGroupLockMask		ok	(1L<<12)		
Xkb Groups Wrap Mask	ok		(1L<<27)		
XkbInternalModsMask	ok		(1L<<28)		
XkbIgnoreLockModsMask	ok		(1L<<29)		
XkbPerKeyRepeatMask	ok		(1L<<30)		
Xkb Controls Enabled Mask	ok		(1L<<31)		
XkbAccessXOptionsMask	ok	ok	(XkbStickyKeysMask		
XkbAccessXFeedbackMask)					
XkbAllBoolean Ctrls Mask		ok	(0x00001FFF)		
XkbAllControlsMask	ok		(0xF8001FFF)		

The *changed\_ctrls* field specifies the controls components that have changed and consists of bits taken from the masks defined in Table 1 with "ok" in the *changed\_ctrls* column.

The controls currently enabled in the server are reported in the <code>enabled\_ctrls</code> field. If any controls were just enabled or disabled (that is, the contents of the <code>enabled\_ctrls</code> field changed), they are flagged in the <code>enabled\_ctrl\_changes</code> field. The valid bits for these fields are the masks listed in Table 1 with "ok" in the <code>enabled\_ctrls</code> column. The <code>num\_groups</code> field reports the number of groups bound to the key belonging to the most number of groups and is automatically updated when the keyboard mapping changes.

If the change was caused by a request from a client, the *keycode* and *event\_type* fields are set to zero and the *req\_major* and *req\_minor* fields identify the request. The *req\_major* value is the same as the major extension opcode. Otherwise, event\_type is set to the type of event that caused the change (one of KeyPress, KeyRelease, DeviceKeyPress, DeviceKeyRelease, ButtonPress or ButtonRelease), and

req\_major and req\_minor are undefined. If event\_type is KeyPress, KeyRelease, DeviceKeyPress, or DeviceKeyRelease, the keycode field is set to the key that caused the change. If event\_type is ButtonPress or ButtonRelease, keycode contains the button number.

When a client receives an XkbControlsNotify event, it can note the changes in a changes structure using XkbNoteControlsChanges.

The *wanted* parameter is a bitwise inclusive OR of bits taken from the set of masks specified in Table 1 with "ok" in the *changed\_ctrls* column. *XkbNoteControlsChanges* copies any changes reported in *new* and specified in *wanted* into the changes record specified by *old*.

### **STRUCTURES**

The structure for the XkbControlsNotify event is defined as follows:

```
typedef struct {
  int
           type;
                      /* Xkb extension base event code */
  unsigned long serial;
                           /* X server serial number for event */
  Bool
             send_event; /* True => synthetically generated */
                          /* server connection where event generated */
  Display *
              display;
  Time
                        /* server time when event generated */
             time;
                         /* XkbCompatMapNotify */
  int
           xkb type;
           device;
                       /* Xkb device ID, will not be XkbUseCoreKbd */
  int
  unsigned int changed_ctrls; /* bits indicating which controls data have changed*/
  unsigned int enabled_ctrls; /* controls currently enabled in server */
  unsigned int enabled_ctrl_changes; /* bits indicating enabled/disabled controls */
  int
           num_groups; /* current number of keyboard groups */
  KeyCode
                            /* != 0 => keycode of key causing change */
               keycode;
            event_type; /* Type of event causing change */
  char
                          /* major event code of event causing change */
  char
            req_major;
  char
            req_minor;
                          /* minor event code of event causing change */
} XkbControlsNotifyEvent;
```
