

**NAME**

`XkbSAGroup` - Returns the `group_XXX` field of `act` converted to a signed int

**SYNOPSIS**

```
int XkbSAGroup (XkbAction act);
```

**ARGUMENTS**

*act* action from which to extract group

**DESCRIPTION**

`XkbSAGroup` returns the `group_XXX` field of `act` converted to a signed int.

**STRUCTURE**

Actions associated with the `XkbGroupAction` structure change the current group state when keys are pressed and released:

```
typedef struct _XkbGroupAction {
    unsigned char  type;    /* XkbSA_{Set|Latch|Lock}Group */
    unsigned char  flags;  /* with type, controls the effect on groups */
    char          group_XXX; /* represents a group index or delta */
} XkbGroupAction;
```
