#### NAME

acl\_set\_fd, acl\_set\_fd\_np, acl\_set\_file, acl\_set\_link\_np - set an ACL for a file

### LIBRARY

Standard C Library (libc, -lc)

#### SYNOPSIS

#include <sys/types.h>
#include <sys/acl.h>

int
acl\_set\_fd(int fd, acl\_t acl);

int

acl\_set\_fd\_np(int fd, acl\_t acl, acl\_type\_t type);

int

acl\_set\_file(const char \*path\_p, acl\_type\_t type, acl\_t acl);

int

acl\_set\_link\_np(const char \*path\_p, acl\_type\_t type, acl\_t acl);

#### DESCRIPTION

The acl\_set\_fd(), acl\_set\_fd\_np(), acl\_set\_file(), and acl\_set\_link\_np() each associate an ACL with an object referred to by *fd* or *path\_p*. The acl\_set\_fd\_np() and acl\_set\_link\_np() functions are not POSIX.1e calls. The acl\_set\_fd() function allows only the setting of ACLs of type ACL\_TYPE\_ACCESS where as acl\_set\_fd\_np() allows the setting of ACLs of any type. The acl\_set\_link\_np() function acts on a symlink rather than its target, if the target of the path is a symlink.

Valid values for the *type* argument are:

ACL\_TYPE\_ACCESSPOSIX.1e access ACLACL\_TYPE\_DEFAULTPOSIX.1e default ACLACL\_TYPE\_NFS4NFSv4 ACL

Trying to set ACL\_TYPE\_NFS4 with *acl* branded as POSIX.1e, or ACL\_TYPE\_ACCESS or ACL\_TYPE\_DEFAULT with ACL branded as NFSv4, will result in error.

#### **IMPLEMENTATION NOTES**

FreeBSD's support for POSIX.1e interfaces and features is still under development at this time.

## **RETURN VALUES**

Upon successful completion, the value 0 is returned; otherwise the value -1 is returned and the global variable *errno* is set to indicate the error.

## ERRORS

If any of the following conditions occur, these functions shall return -1 and set *errno* to the corresponding value:

[EACCES]	Search permission is denied for a component of the path prefix, or the object exists and the process does not have appropriate access rights.
[EBADF]	The <i>fd</i> argument is not a valid file descriptor.
[EINVAL]	Argument <i>acl</i> does not point to a valid ACL for this object, or the ACL type specified in <i>type</i> is invalid for this object, or there is branding mismatch.
[ENAMETOOLONG]	
L	A component of a pathname exceeded 255 characters, or an entire path name exceeded 1023 characters.
[ENOENT]	The named object does not exist, or the <i>path_p</i> argument points to an empty string.
[ENOMEM]	Insufficient memory available to fulfill request.
[ENOSPC]	The directory or file system that would contain the new ACL cannot be extended, or the file system is out of file allocation resources.
[EOPNOTSUPP]	The file system does not support ACL retrieval.
[EROFS]	This function requires modification of a file system which is currently read-only.

### STANDARDS

POSIX.1e is described in IEEE POSIX.1e draft 17. Discussion of the draft continues on the crossplatform POSIX.1e implementation mailing list. To join this list, see the FreeBSD POSIX.1e implementation page for more information.

# HISTORY

POSIX.1e support was introduced in FreeBSD 4.0, and development continues.
