

**NAME**

asn1\_write\_value - API function

**SYNOPSIS**

```
#include <libtasn1.h>
```

```
int asn1_write_value(asn1_node node_root, const char * name, const void * ivalue, int len);
```

**ARGUMENTS**

asn1\_node node\_root

pointer to a structure

const char \* name

the name of the element inside the structure that you want to set.

const void \* ivalue

vector used to specify the value to set. If len is >0, VALUE must be a two's complement form integer. if len=0 \*VALUE must be a null terminated string with an integer value.

int len

number of bytes of \*value to use to set the value: value[0]..value[len-1] or 0 if value is a null terminated string

**DESCRIPTION**

Set the value of one element inside a structure.

If an element is OPTIONAL and you want to delete it, you must use the value=NULL and len=0.

Using "pkix.asn":

```
result=asn1_write_value(cert, "tbsCertificate.issuerUniqueID", NULL, 0);
```

Description for each type:

**INTEGER**

VALUE must contain a two's complement form integer.

```
value[0]=0xFF , len=1 -> integer=-1. value[0]=0xFF value[1]=0xFF , len=2 -> integer=-1.
value[0]=0x01 , len=1 -> integer= 1. value[0]=0x00 value[1]=0x01 , len=2 -> integer= 1.
value="123" , len=0 -> integer= 123.
```

**ENUMERATED**

As INTEGER (but only with not negative numbers).

## BOOLEAN

VALUE must be the null terminated string "TRUE" or "FALSE" and LEN != 0.

value="TRUE" , len=1 -> boolean=TRUE. value="FALSE" , len=1 -> boolean=FALSE.

OBJECT IDENTIFIER: VALUE must be a null terminated string with each number separated by a dot (e.g. "1.2.3.543.1"). LEN != 0.

value="1 2 840 10040 4 3" , len=1 -> OID=dsa-with-sha.

## UTCTIME

VALUE must be a null terminated string in one of these formats: "YYMMDDhhmmssZ", "YYMMDDhhmmssZ", "YYMMDDhhmmss+hh'mm'", "YYMMDDhhmmss-hh'mm'", "YYMMDDhhmm+hh'mm'", or "YYMMDDhhmm-hh'mm'". LEN != 0.

value="9801011200Z" , len=1 -> time=January 1st, 1998 at 12h 00m Greenwich Mean Time

## GENERALIZEDTIME

VALUE must be in one of this format: "YYYYMMDDhhmmss.sZ", "YYYYMMDDhhmmss.sZ", "YYYYMMDDhhmmss.s+hh'mm'", "YYYYMMDDhhmmss.s-hh'mm'", "YYYYMMDDhhmm+hh'mm'", or "YYYYMMDDhhmm-hh'mm'" where ss.s indicates the seconds with any precision like "10.1" or "01.02". LEN != 0

value="2001010112001.12-0700" , len=1 -> time=January 1st, 2001 at 12h 00m 01.12s Pacific Daylight Time

OCTET STRING: VALUE contains the octet string and LEN is the number of octets.

value="\$sh\$x01\$sh\$x02\$sh\$x03" , len=3 -> three bytes octet string

## GENERALSTRING

VALUE contains the generalstring and LEN is the number of octets.

value="\$sh\$x01\$sh\$x02\$sh\$x03" , len=3 -> three bytes generalstring

BIT STRING: VALUE contains the bit string organized by bytes and LEN is the number of bits.

value="\$sh\$xCF" , len=6 -> bit string="110011" (six bits)

**CHOICE**

if NAME indicates a choice type, VALUE must specify one of the alternatives with a null terminated string. LEN != 0. Using "pkix.asn"

```
result=asn1_write_value(cert, "certificate1.tbsCertificate.subject", "rdnSequence", 1);
```

**ANY**

VALUE indicates the der encoding of a structure. LEN != 0.

SEQUENCE OF: VALUE must be the null terminated string "NEW" and LEN != 0. With this instruction another element is appended in the sequence. The name of this element will be "?1" if it's the first one, "?2" for the second and so on.

Using "pkix.asn"

```
result=asn1_write_value(cert, "certificate1.tbsCertificate.subject.rdnSequence", "NEW", 1);
```

SET OF: the same as SEQUENCE OF. Using "pkix.asn":

```
result=asn1_write_value(cert, "tbsCertificate.subject.rdnSequence.?LAST", "NEW", 1);
```

**RETURNS**

**ASN1\_SUCCESS** if the value was set, **ASN1\_ELEMENT\_NOT\_FOUND** if *name* is not a valid element, and **ASN1\_VALUE\_NOT\_VALID** if *ivalue* has a wrong format.
