NAME

auditon - configure system audit parameters

SYNOPSIS

#include <bsm/audit.h>

int

auditon(int cmd, void *data, u_int length);

DESCRIPTION

The **auditon**() system call is used to manipulate various audit control operations. The *data* argument should point to a structure whose type depends on the command. The *length* argument specifies the size of **data* in bytes. The *cmd* argument may be any of the following:

A_SETPOLICY	Set audit policy flags. The <i>data</i> argument must point to a <i>int</i> value set to one or more the following audit policy control values bitwise OR'ed together: AUDIT_CNT, AUDIT_AHLT, AUDIT_ARGV, and AUDIT_ARGE. If AUDIT_CNT is set, the system will continue even if it becomes low on space and discontinue logging events until the low space condition is remedied. If it is not set, audited events will block until the low space condition is remedied. Unaudited events, however, are unaffected. If AUDIT_AHLT is set, a panic(9) if it cannot write an event to the global audit log file. If AUDIT_ARGV is set, then the argument list passed to the execve(2) system call will be audited. If AUDIT_ARGE is set, then the environment variables passed to the execve(2) system call will be audited. The default policy is none of the audit policy control flags set.
A_SETKAUDIT	Set the host information. The <i>data</i> argument must point to a <i>auditinfo_addr_t</i> structure containing the host IP address information. After setting, audit records that are created as a result of kernel events will contain this information.
A_SETKMASK	Set the kernel preselection masks (success and failure). The <i>data</i> argument must point to a <i>au_mask_t</i> structure containing the mask values as defined in <i><bsm audit.h=""></bsm></i> . These masks are used for non-attributable audit event preselection. The field <i>am_success</i> specifies which classes of successful audit events are to be logged to the audit trail. The field <i>am_failure</i> specifies which classes of failed audit events are to be logged. The value of both fields is the bitwise OR'ing of the audit event classes specified in <i>bsm/audit h</i> . The various audit classes are described more fully in

AUDITON(2)

audit_class(5).

A_SETQCTRL Set kernel audit queue parameters. The *data* argument must point to a *au_qctrl_t* structure (defined in *<bsm/audit.h>*) containing the kernel audit queue control settings: aq_hiwater, aq_lowater, aq_bufsz, aq_delay, and aq minfree. The field aq hiwater defines the maximum number of audit record entries in the queue used to store the audit records ready for delivery to disk. New records are inserted at the tail of the queue and removed from the head. For new records which would exceed the high water mark, the calling thread is inserted into the wait queue, waiting for the audit queue to have enough space available as defined with the field aq_lowater. The field aq_bufsz defines the maximum length of the audit record that can be supplied with audit(2). The field aq delay is unused. The field aq minfree specifies the minimum amount of free blocks on the disk device used to store audit records. If the value of free blocks falls below the configured minimum amount, the kernel informs the audit daemon about low disk space. The value is to be specified in percent of free file system blocks. A value of 0 results in a disabling of the check. The default and maximum values (default/maximum) for the audit queue control parameters are: 100/10000 (audit records) aq hiwater aq lowater 10/aq_hiwater (audit records) 32767/1048576 (bytes) aq_bufsz aq_delay (Not currently used.) A_SETSTAT Return ENOSYS. (Not implemented.) Return ENOSYS. (Not implemented.) A_SETUMASK A_SETSMASK Return ENOSYS. (Not implemented.) A SETCOND Set the current auditing condition. The *data* argument must point to a *int* value containing the new audit condition, one of AUC AUDITING, AUC NOAUDIT, or AUC DISABLED. If AUC NOAUDIT is set, then auditing is temporarily suspended. If AUC_AUDITING is set, auditing is resumed. If AUC_DISABLED is set, the auditing system will shutdown, draining all audit records and closing out the audit trail file. A SETCLASS Set the event class preselection mask for an audit event. The data argument must point to a *au_evclass_map_t* structure containing the audit event and

AUDITON(2)	FreeBSD System Calls Manual	AUDITON(2)
	mask. The field <i>ec_number</i> is the audit event and <i>ec</i> mask. See audit_event(5) for more information on a mapping.	<i>c_class</i> is the audit class audit event to class
A_SETPMASK	Set the preselection masks for a process. The <i>data</i> a <i>auditpinfo_t</i> structure that contains the given process masks for both success and failure. The field <i>ap_pia</i> target process. The field <i>ap_mask</i> must point to a <i>au</i> which holds the preselection masks as described in the section above.	argument must point to a s's audit preselection d is the process id of the u_mask_t structure the A_SETKMASK
A_SETFSIZE	Set the maximum size of the audit log file. The <i>data</i> a <i>au_fstat_t</i> structure with the <i>af_filesz</i> field set to the file size. A value of 0 indicates no limit to the size.	a argument must point to ne maximum audit log
A_GETCLASS	Return the event to class mapping for the designated argument must point to a <i>au_evclass_map_t</i> structure A_SETCLASS section above for more information.	l audit event. The <i>data</i> re. See the
A_GETKAUDIT	Get the current host information. The <i>data</i> argumen <i>auditinfo_addr_t</i> structure.	it must point to a
A_GETPINFO	Return the audit settings for a process. The <i>data</i> arg <i>auditpinfo_t</i> structure which will be set to contain <i>ap</i> <i>ap_mask</i> (the preselection mask), <i>ap_termid</i> (the ter (the audit session ID) of the given target process. The target process is passed into the kernel using the <i>ap_</i> section A_SETPMASK above and getaudit(2) for magnetic section A_SETPMASK above and getaudit(3) for magnetic section A_SETPMASK above abo	gument must point to a <i>p_auid</i> (the audit ID), rminal ID), and <i>ap_asid</i> he process ID of the <i>_pid</i> field. See the nore information.
A_GETPINFO_ADDR	Return the extended audit settings for a process. The point to a <i>auditpinfo_addr_t</i> structure which is similar structure described above. The exception is the <i>ap_</i> field which points to a <i>au_tid_addr_t</i> structure can be terminal address and an address type. The process I is passed into the kernel using the <i>ap_pid</i> field. See A_SETPMASK above and getaudit(2) for more infor	e <i>data</i> argument must far to the <i>auditpinfo_t</i> <i>termid</i> (the terminal ID) nold much a larger D of the target process the section prmation.
A_GETSINFO_ADDR	Return the extended audit settings for a session. The point to a <i>auditinfo_addr_t</i> structure. The audit sess session is passed into the kernel using the <i>ai_asid</i> for	e <i>data</i> argument must sion ID of the target eld. See

AUDITON(2)	FreeBSD System Calls Manual	AUDITON(2)
	getaudit_addr(2) for more information about the aud	<i>ditinfo_addr_t</i> structure.
A_GETKMASK	Return the current kernel preselection masks. The <i>data</i> argument must point to a <i>au_mask_t</i> structure which will be set to the current kernel preselection masks for non-attributable events.	
A_GETPOLICY	Return the current audit policy setting. The <i>data</i> arg <i>int</i> value which will be set to one of the current audi policy flags are described in the A_SETPOLICY set	gument must point to a it policy flags. The audit ction above.
A_GETQCTRL	Return the current kernel audit queue control parame argument must point to a <i>au_qctrl_t</i> structure which current kernel audit queue control parameters. See t section above for more information.	eters. The <i>data</i> will be set to the the A_SETQCTL
A_GETFSIZE	Returns the maximum size of the audit log file. The point to a <i>au_fstat_t</i> structure. The <i>af_filesz</i> field wi maximum audit log file size. A value of 0 indicates The <i>af_currsz</i> field will be set to the current audit log	e <i>data</i> argument must ill be set to the no limit to the size. og file size.
A_GETCWD	Return ENOSYS. (Not implemented.)	
A_GETCAR	Return ENOSYS. (Not implemented.)	
A_GETSTAT	Return ENOSYS. (Not implemented.)	
A_GETCOND	Return the current auditing condition. The <i>data</i> arguint value which will be set to the current audit condi AUC_AUDITING, AUC_NOAUDIT or AUC_DISA_SETCOND section above for more information.	ument must point to a tion, one of ABLED. See the
A_SENDTRIGGER	Send a trigger to the audit daemon. The <i>data</i> argum value set to one of the acceptable trigger values: AUDIT_TRIGGER_LOW_SPACE (low disk space resides), AUDIT_TRIGGER_OPEN_NEW (open a AUDIT_TRIGGER_READ_FILE (read the <i>audit_c</i> AUDIT_TRIGGER_CLOSE_AND_DIE (close the exit), AUDIT_TRIGGER_NO_SPACE (no disk spa file). AUDIT_TRIGGER_ROTATE_USER (reques AUDIT_TRIGGER_INITIALIZE (initialize audit su	where the audit log new audit log file), <i>control</i> file), current log file and ace left for audit log st audit log file rotation). ubsystem for Mac OS X

only). or AUDIT_TRIGGER_EXPIRE_TRAILS (request audit log file expiration).

RETURN VALUES

Upon successful completion, the value 0 is returned; otherwise the value -1 is returned and the global variable *errno* is set to indicate the error.

ERRORS

The **auditon**() function will fail if:

[ENOSYS]	Returned by options not yet implemented.
[EFAULT]	A failure occurred while data transferred to or from the kernel failed.
[EINVAL]	Illegal argument was passed by a system call.
[EPERM]	The process does not have sufficient permission to complete the operation

The A_SENDTRIGGER command is specific to the FreeBSD and Mac OS X implementations, and is not present in Solaris.

HISTORY

The OpenBSM implementation was created by McAfee Research, the security division of McAfee Inc., under contract to Apple Computer Inc. in 2004. It was subsequently adopted by the TrustedBSD Project as the foundation for the OpenBSM distribution.

AUTHORS

This software was created by McAfee Research, the security research division of McAfee, Inc., under contract to Apple Computer Inc. Additional authors include Wayne Salamon, Robert Watson, and SPARTA Inc.

The Basic Security Module (BSM) interface to audit records and audit event stream format were defined by Sun Microsystems.

This manual page was written by Tom Rhodes <trhodes@FreeBSD.org>, Robert Watson <rwatson@FreeBSD.org>, and Wayne Salamon <wsalamon@FreeBSD.org>.
