### NAME

avahi-publish-service - Register an mDNS/DNS-SD service or host name or address mapping using the Avahi daemon

### SYNOPSIS

avahi-publish -s [options] name service-type port [TXT data ...]

avahi-publish-service [options] name service-type port [TXT data ...]

avahi-publish -a [options] host name address

avahi-publish-address [options] host name address

### DESCRIPTION

Register an mDNS/DNS-SD service or host name/address mapping using the Avahi daemon.

### **OPTIONS**

When calling in service registration mode, specify a DNS-SD service name (e.g. "Lennart's Files"), a service type (e.g. \_http.\_tcp) and an IP port number for the service, optionally followed by any number of TXT record strings on the command line. When calling in address/host name registration mode specify a fully qualified host name and an address (IPv4 or IPv6).

#### -s | --service

Register a service. avahi-publish-service is equivalent to avahi-publish -s.

#### -a | --address

Register an address/host name mapping. avahi-publish-address is equivalent to avahi-publish -a.

#### -v | --verbose

Enable verbose mode.

### -**H** | --**host**= *HOSTNAME*

Specify a host name for this service, in case it doesn't reside on the local host. This host name needs to be fully qualified and resolvable using mDNS or unicast DNS.

#### -d | --domain= DOMAIN

Publish the service in the specified domain. If omitted the Avahi daemon will publish it in its default domain (usually .local).

#### --subtype= *SUBTYPE*

Register the service with an additional subtype in addition to the main type. DNS-SD subtypes have the form \_anon.\_sub.\_ftp.\_tcp, where \_anon is the identifier of the subtype and \_ftp.\_tcp is the main type. You may pass this option multiple times to register the service with multiple subtypes.

## -f | --no-fail

Don't fail if the daemon is not found running. Instead, wait until it appears. If it disconnects, try to reconnect.

## -h | --help

Show help

# -V | --version

Show version information.
