

NAME

`bf_compact` - shell script to compact a bogofilter directory

SYNOPSIS

bf_compact *bogofilter_directory* [*wordlist_name...*]

DESCRIPTION

bf_compact creates a more compact bogofilter working directory with a dump/load cycle and renames the previous *bogofilter_directory* to *bogofilter_directory.old*.

Note: **bf_compact** cannot be used to process the current working directory, ".", because that cannot be renamed.

If no *wordlist_file* arguments are given, then **bf_compact** will use the configured set of wordlists, if the given *bogofilter_directory* is the same as the configured, or use all *.db files if it is a different directory.

EXIT STATUS

The script exits with status code 0 if everything went well, and nonzero if it encountered trouble.

NOTES

This script will delete *bogofilter_directory.old* and all of its contents!

This script expects a SUSv2 compliant shell. Solaris systems should have the SUNWxcu4 package installed (when bogofilter is configured) so that /usr/xpg4/bin/sh can be used.
