

NAME

`curl_multi_setopt` - set options for a curl multi handle

SYNOPSIS

```
#include <curl/curl.h>
```

```
CURLMcode curl_multi_setopt(CURLM *multi_handle, CURLMoption option, parameter);
```

DESCRIPTION

`curl_multi_setopt(3)` is used to tell a libcurl multi handle how to behave. By using the appropriate options to `curl_multi_setopt(3)`, you can change libcurl's behavior when using that multi handle. All options are set with the *option* followed by the *parameter*. That parameter can be a **long**, a **function pointer**, an **object pointer** or a **curl_off_t** type, depending on what the specific option expects. Read this manual carefully as bad input values may cause libcurl to behave badly. You can only set one option in each function call.

RETURN VALUE

The standard CURLMcode for multi interface error codes. Note that it returns a CURLM_UNKNOWN_OPTION if you try setting an option that this version of libcurl does not know of.
