NAME

dblink_send_query - sends an async query to a remote database

SYNOPSIS

dblink_send_query(text connname, text sql) returns int

DESCRIPTION

dblink_send_query sends a query to be executed asynchronously, that is, without immediately waiting for the result. There must not be an async query already in progress on the connection.

After successfully dispatching an async query, completion status can be checked with **dblink_is_busy**, and the results are ultimately collected with **dblink_get_result**. It is also possible to attempt to cancel an active async query using **dblink_cancel_query**.

ARGUMENTS

connname

Name of the connection to use.

sql

The SQL statement that you wish to execute in the remote database, for example select * from pg_class.

RETURN VALUE

Returns 1 if the query was successfully dispatched, 0 otherwise.

EXAMPLES

SELECT dblink_send_query('dtest1', 'SELECT * FROM foo WHERE f1 < 3');
