### NAME

device\_get\_state, device\_busy, device\_unbusy, device\_is\_alive, device\_is\_attached - manipulate device state

### SYNOPSIS

#include <sys/param.h>
#include <sys/bus.h>

device\_state\_t
device\_get\_state(device\_t dev);

void
device\_busy(device\_t dev);

void
device\_unbusy(device\_t dev);

int
device\_is\_alive(device\_t dev);

int
device\_is\_attached(device\_t dev);

# DESCRIPTION

The current state of a device is accessed by calling **device\_get\_state**() which returns DS\_NOTPRESENT, DS\_ALIVE, DS\_ATTACHED or DS\_BUSY (described in device(9)). To test see if a device was successfully probed, call **device\_is\_alive**() which simply returns if the state is greater or equal to DS\_ALIVE. To test see if a device was successfully attached, call **device\_is\_attached**() which simply returns if the state is greater or equal to DS\_ATTACHED.

Each device has a busy count which is incremented when **device\_busy**() is called and decremented when **device\_unbusy**() is called. Both routines return an error if the device state is less than DS\_ATTACHED.

When **device\_busy**() is called on a device in the DS\_ATTACHED state, the device changes to the DS\_BUSY state. When **device\_unbusy**() is called and after decrementing, the busy count for the device is zero, the device changes to the DS\_ATTACHED state.
