

**NAME**

**curs\_sp\_funcs** - *curses* screen-pointer extension

**SYNOPSIS**

```
#include <curses.h>
```

```
int alloc_pair_sp(SCREEN* sp, int fg, int bg);
int assume_default_colors_sp(SCREEN* sp, int fg, int bg);
int baudrate_sp(SCREEN* sp);
int beep_sp(SCREEN* sp);
bool can_change_color_sp(SCREEN* sp);
int cbreak_sp(SCREEN* sp);
int color_content_sp(SCREEN* sp, short color, short* r, short* g, short* b);
int curs_set_sp(SCREEN* sp, int visibility);
int def_prog_mode_sp(SCREEN* sp);
int def_shell_mode_sp(SCREEN* sp);

int define_key_sp(SCREEN* sp, const char * definition, int keycode);
int delay_output_sp(SCREEN* sp, int ms);
int doupdate_sp(SCREEN* sp);
int echo_sp(SCREEN* sp);
int endwin_sp(SCREEN* sp);
char erasechar_sp(SCREEN* sp);
int erasewchar_sp(SCREEN* sp, wchar_t *wc);
int extended_color_content_sp(SCREEN* sp, int color, int * r, int * g, int * b);
int extended_pair_content_sp(SCREEN* sp, int pair, int * fg, int * bg);
int extended_slk_color_sp(SCREEN* sp, int pair);

#include <unctrl.h>

NCURSES_CONST char* unctrl_sp(SCREEN* sp, chtype ch);

```

## DESCRIPTION

This implementation can be configured to provide a set of functions which improve the ability to manage multiple screens. This feature can be added to any of the configurations supported by *ncurses*; it adds new symbols without changing the meaning of any of the existing ones.

### Improved Functions

Most of the functions are new versions of existing functions. A parameter is added at the front of the parameter list. It is a *SCREEN* pointer.

The existing functions all use the current screen, which is a static variable. The extended functions use the specified screen, thereby reducing the number of variables which must be modified to update multiple screens.

### New Functions

Here are the new functions:

`ceiling_panel`

this returns a pointer to the topmost panel in the given screen.

`ground_panel`

this returns a pointer to the lowest panel in the given screen.

`new_prescr`

when creating a new screen, the library uses static variables which have been preset, e.g., by `use_env(3X)`, `filter(3X)`, etc. With the screen-pointer extension, there are situations where it must create a current screen before the unextended library does. The `new_prescr` function is used internally to handle these cases. It is also provided to allow applications to customize library initialization.

## NOTES

This extension introduces some new names:

#### NCURSES\_SP\_FUNCS

This is set to the library patch-level number. In the unextended library, this is zero (0), to make it useful for checking if the extension is provided.

#### NCURSES\_SP\_NAME

The new functions are named using the macro *NCURSES\_SP\_NAME*, which hides the actual implementation. Currently this adds a "\_sp" suffix to the name of the unextended function. This manual page indexes the extensions showing the full name. However the proper usage of these functions uses the macro, to provide for the possibility of changing the naming convention for specific library configurations.

#### NCURSES\_SP\_OUTC

This is a new function-pointer type to use in the screen-pointer functions where an *NCURSES\_OUTC* is used in the unextended library.

#### NCURSES\_OUTC

This is a function-pointer type used for the cases where a function passes characters to the output stream, e.g., **vidputs(3X)**.

### PORTABILITY

These routines are specific to *ncurses*. They were not supported on Version 7, BSD or System V implementations. It is recommended that any code depending on *ncurses* extensions be conditioned using *NCURSES\_SP\_FUNCS*.
