

NAME**fegetround, fesetround** - floating-point rounding control**LIBRARY**

Math Library (libm, -lm)

SYNOPSIS

#include <fenv.h>

#pragma STDC FENV_ACCESS ON

*int***fegetround**(*void*);*int***fesetround**(*int round*);**DESCRIPTION**

The **fegetround()** function determines the current floating-point rounding mode, and the **fesetround()** function sets the current rounding mode to *round*. The rounding mode is one of FE_TONEAREST, FE_DOWNWARD, FE_UPWARD, or FE_TOWARDZERO, as described in *fenv(3)*.

RETURN VALUES

The **fegetround()** routine returns the current rounding mode. The **fesetround()** function returns 0 on success and non-zero otherwise; however, the present implementation always succeeds.

SEE ALSO*fenv(3), fpgetround(3), fpsetround(3)***STANDARDS**

The **fegetround()** and **fesetround()** functions conform to ISO/IEC 9899:1999 ("ISO C99").

HISTORY

These routines first appeared in FreeBSD 5.3. They supersede the non-standard *fpgetround(3)* and *fpsetround(3)* functions.
