

NAME

fexecv() - executes a program

SYNOPSIS

fexecv(name, in, out, err, ac, av)

char *name;

FILE *in, *out, *err;

int ac;

char **av;

DESCRIPTION

fexecv() functions identically to fexecve() except that fexecv() passes the current environment list (environ) to the new program, where fexecve() passes the environment list specified as one of its arguments.

RETURNS

Returns a system error code; fexecv() does not normally return.
