NAME

fido_strerr - FIDO2 error codes

SYNOPSIS

#include <fido.h>

const char *
fido_strerr(*int n*);

DESCRIPTION

The **fido_strerr**() function translates the error code *n* into a readable string, where *n* is an error code
defined in *<fido/err.h>*. **fido_strerr**() never returns NULL. Returned pointers point to static strings.
