

**NAME**

**getitimer**, **setitimer** - get/set value of interval timer

**LIBRARY**

Standard C Library (libc, -lc)

**SYNOPSIS**

```
#include <sys/time.h>
```

```
#define ITIMER_REAL    0
#define ITIMER_VIRTUAL 1
#define ITIMER_PROF    2
```

*int*

```
getitimer(int which, struct itimerval *value);
```

*int*

```
setitimer(int which, const struct itimerval *value, struct itimerval *ovalue);
```

**DESCRIPTION**

The system provides each process with three interval timers, defined in *<sys/time.h>*. The **getitimer()** system call returns the current value for the timer specified in *which* in the structure at *value*. The **setitimer()** system call sets a timer to the specified *value* (returning the previous value of the timer if *ovalue* is not a null pointer).

A timer value is defined by the *itimerval* structure:

```
struct itimerval {
    struct    timeval it_interval; /* timer interval */
    struct    timeval it_value;   /* current value */
};
```

If *it\_value* is non-zero, it indicates the time to the next timer expiration. If *it\_interval* is non-zero, it specifies a value to be used in reloading *it\_value* when the timer expires. Setting *it\_value* to 0 disables a timer, regardless of the value of *it\_interval*. Setting *it\_interval* to 0 causes a timer to be disabled after its next expiration (assuming *it\_value* is non-zero).

Time values smaller than the resolution of the system clock are rounded up to this resolution (typically 10 milliseconds).

The `ITIMER_REAL` timer decrements in real time. A `SIGALRM` signal is delivered when this timer expires.

The `ITIMER_VIRTUAL` timer decrements in process virtual time. It runs only when the process is executing. A `SIGVTALRM` signal is delivered when it expires.

The `ITIMER_PROF` timer decrements both in process virtual time and when the system is running on behalf of the process. It is designed to be used by interpreters in statistically profiling the execution of interpreted programs. Each time the `ITIMER_PROF` timer expires, the `SIGPROF` signal is delivered. Because this signal may interrupt in-progress system calls, programs using this timer must be prepared to restart interrupted system calls.

The maximum number of seconds allowed for `it_interval` and `it_value` in `setitimer()` is 100000000.

## NOTES

Three macros for manipulating time values are defined in `<sys/time.h>`. The `timerclear()` macro sets a time value to zero, `timerisset()` tests if a time value is non-zero, and `timercmp()` compares two time values.

## RETURN VALUES

Upon successful completion, the value 0 is returned; otherwise the value -1 is returned and the global variable `errno` is set to indicate the error.

## ERRORS

The `getitimer()` and `setitimer()` system calls will fail if:

[EFAULT]           The *value* argument specified a bad address.

[EINVAL]           The *value* argument specified a time that was too large to be handled.

## SEE ALSO

`gettimeofday(2)`, `select(2)`, `sigaction(2)`, `clocks(7)`

## STANDARDS

The `getitimer()` and `setitimer()` functions conform to IEEE Std 1003.1-2001 ("POSIX.1"). The later IEEE Std 1003.1-2008 ("POSIX.1") revision however marked both functions as obsolescent, recommending the use of `timer_gettime(2)` and `timer_settime(2)` instead.

## HISTORY

The `getitimer()` system call appeared in 4.2BSD.
