

NAME

`git-whatchanged` - Show logs with differences each commit introduces

SYNOPSIS

git whatchanged <option>...

DESCRIPTION

Shows commit logs and diff output each commit introduces.

New users are encouraged to use **git-log(1)** instead. The **whatchanged** command is essentially the same as **git-log(1)** but defaults to showing the raw format diff output and skipping merges.

The command is primarily kept for historical reasons; fingers of many people who learned Git long before **git log** was invented by reading the Linux kernel mailing list are trained to type it.

EXAMPLES

git whatchanged -p v2.6.12.. include/scsi drivers/scsi

Show as patches the commits since version *v2.6.12* that changed any file in the *include/scsi* or *drivers/scsi* subdirectories

git whatchanged --since="2 weeks ago" -- gitk

Show the changes during the last two weeks to the file *gitk*. The "--" is necessary to avoid confusion with the **branch** named *gitk*

GIT

Part of the **git(1)** suite
