

NAME

gnutls_bye - API function

SYNOPSIS

```
#include <gnutls/gnutls.h>
```

```
int gnutls_bye(gnutls_session_t session, gnutls_close_request_t how);
```

ARGUMENTS

gnutls_session_t session

is a **gnutls_session_t** type.

gnutls_close_request_t how

is an integer

DESCRIPTION

Terminates the current TLS/SSL connection. The connection should have been initiated using **gnutls_handshake()**. *how* should be one of **GNUTLS_SHUT_RDWR**, **GNUTLS_SHUT_WR**.

In case of **GNUTLS_SHUT_RDWR** the TLS session gets terminated and further receives and sends will be disallowed. If the return value is zero you may continue using the underlying transport layer. **GNUTLS_SHUT_RDWR** sends an alert containing a close request and waits for the peer to reply with the same message.

In case of **GNUTLS_SHUT_WR** the TLS session gets terminated and further sends will be disallowed. In order to reuse the connection you should wait for an EOF from the peer. **GNUTLS_SHUT_WR** sends an alert containing a close request.

Note that not all implementations will properly terminate a TLS connection. Some of them, usually for performance reasons, will terminate only the underlying transport layer, and thus not distinguishing between a malicious party prematurely terminating the connection and normal termination.

This function may also return **GNUTLS_E_AGAIN** or **GNUTLS_E_INTERRUPTED**; cf. **gnutls_record_get_direction()**.

RETURNS

GNUTLS_E_SUCCESS on success, or an error code, see function documentation for entire semantics.
