

NAME

gnutls_certificate_get_x509_cert - API function

SYNOPSIS

```
#include <gnutls/gnutls.h>
```

```
int gnutls_certificate_get_x509_cert(gnutls_certificate_credentials_t res, unsigned index,  
gnutls_x509_cert_t ** crt_list, unsigned * crt_list_size);
```

ARGUMENTS

gnutls_certificate_credentials_t res

is a **gnutls_certificate_credentials_t** type.

unsigned index

The index of the certificate list to obtain.

gnutls_x509_cert_t ** crt_list

Where to store the certificate list.

unsigned * crt_list_size

Will hold the number of certificates.

DESCRIPTION

Obtains a X.509 certificate list that has been stored in *res* with one of

gnutls_certificate_set_x509_key(), **gnutls_certificate_set_key()**,
gnutls_certificate_set_x509_key_file(), **gnutls_certificate_set_x509_key_file2()**,
gnutls_certificate_set_x509_key_mem(), or **gnutls_certificate_set_x509_key_mem2()**. Each certificate
in the returned certificate list must be deallocated with **gnutls_x509_cert_deinit()**, and the list itself must
be freed with **gnutls_free()**.

The *index* matches the return value of **gnutls_certificate_set_x509_key()** and friends functions, when
the **GNUTLS_CERTIFICATE_API_V2** flag is set.

If there is no certificate with the given index,

GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE is returned. If the certificate with the given
index is not a X.509 certificate, **GNUTLS_E_INVALID_REQUEST** is returned. The returned
certificates must be deinitialized after use, and the *crt_list* pointer must be freed using **gnutls_free()**.

RETURNS

GNUTLS_E_SUCCESS (0) on success, or a negative error code.

SINCE

3.4.0
