gnutls

#### NAME

gnutls\_privkey\_import\_ext3 - API function

## SYNOPSIS

#include <gnutls/abstract.h>

int gnutls\_privkey\_import\_ext3(gnutls\_privkey\_t pkey, void \* userdata, gnutls\_privkey\_sign\_func sign\_fn, gnutls\_privkey\_decrypt\_func decrypt\_fn, gnutls\_privkey\_deinit\_func deinit\_fn, gnutls\_privkey\_info\_func info\_fn, unsigned int flags);

## ARGUMENTS

gnutls\_privkey\_t pkey The private key

void \* userdata

private data to be provided to the callbacks

gnutls\_privkey\_sign\_func sign\_fn callback for signature operations

gnutls\_privkey\_decrypt\_func decrypt\_fn callback for decryption operations

gnutls\_privkey\_deinit\_func deinit\_fn a deinitialization function

gnutls\_privkey\_info\_func info\_fn returns info about the public key algorithm (should not be **NULL**)

unsigned int flags Flags for the import

## DESCRIPTION

This function will associate the given callbacks with the **gnutls\_privkey\_t** type. At least one of the two callbacks must be non-null. If a deinitialization function is provided then flags is assumed to contain **GNUTLS\_PRIVKEY\_IMPORT\_AUTO\_RELEASE**.

Note that the signing function is supposed to "raw" sign data, i.e., without any hashing or preprocessing. In case of RSA the DigestInfo will be provided, and the signing function is expected to do the PKCS **1** 1.5 padding and the exponentiation.

The *info\_fn* must provide information on the algorithms supported by this private key, and should support the flags **GNUTLS\_PRIVKEY\_INFO\_PK\_ALGO** and **GNUTLS\_PRIVKEY\_INFO\_SIGN\_ALGO**. It must return -1 on unknown flags.

#### RETURNS

On success, GNUTLS\_E\_SUCCESS (0) is returned, otherwise a negative error value.

#### SINCE

3.4.0
