NAME
grdc - grand digital clock (curses)

SYNOPSIS
grdc [**-st**] [*n*]

DESCRIPTION
grdc runs a digital clock made of reverse-video blanks on a curses compatible VDU screen. With an optional numeric argument *n* it stops after *n* seconds (default never). The optional **-s** flag makes digits scroll as they change. The optional **-t** flag tells grdc to output the time in a 12-hour format. In this curses mode implementation, the scrolling option has trouble keeping up.

ENVIRONMENT
TZ   The time zone to use for displaying the time. It is normally specified as a pathname relative to */usr/share/zoneinfo*, though see tzset(3) for more information. If this variable is not set, the time zone is determined based on */etc/localtime*.

AUTHORS
Amos Shapir, modified for curses by John Lupien.
