

**NAME**

**hcreate**, **hcreate\_r**, **hdestroy**, **hdestroy\_r**, **hsearch**, **hsearch\_r** - manage hash search table

**LIBRARY**

Standard C Library (libc, -lc)

**SYNOPSIS**

```
#include <search.h>
```

*int*

```
hcreate(size_t nel);
```

*int*

```
hcreate_r(size_t nel, struct hsearch_data *table);
```

*void*

```
hdestroy(void);
```

*void*

```
hdestroy_r(struct hsearch_data *table);
```

*ENTRY \**

```
hsearch(ENTRY item, ACTION action);
```

*int*

```
hsearch_r(ENTRY item, ACTION action, ENTRY ** itemp, struct hsearch_data *table);
```

**DESCRIPTION**

The **hcreate()**, **hcreate\_r()**, **hdestroy()**, **hdestroy\_r()** **hsearch()**, and **hsearch\_r()** functions manage hash search tables.

The **hcreate()** function allocates sufficient space for the table, and the application should ensure it is called before **hsearch()** is used. The *nel* argument is an estimate of the maximum number of entries that the table should contain. As this implementation resizes the hash table dynamically, this argument is ignored.

The **hdestroy()** function disposes of the search table, and may be followed by another call to **hcreate()**. After the call to **hdestroy()**, the data can no longer be considered accessible. The **hdestroy()** function calls free(3) for each comparison key in the search table but not the data item associated with the key.

The **hsearch()** function is a hash-table search routine. It returns a pointer into a hash table indicating the location at which an entry can be found. The *item* argument is a structure of type *ENTRY* (defined in the *<search.h>* header) that contains two pointers: *item.key* points to the comparison key (a *char \**), and *item.data* (a *void \**) points to any other data to be associated with that key. The comparison function used by **hsearch()** is `strcmp(3)`. The *action* argument is a member of an enumeration type *ACTION* indicating the disposition of the entry if it cannot be found in the table. `ENTER` indicates that the *item* should be inserted in the table at an appropriate point. `FIND` indicates that no entry should be made. Unsuccessful resolution is indicated by the return of a NULL pointer.

The comparison key (passed to **hsearch()** as *item.key*) must be allocated using `malloc(3)` if *action* is `ENTER` and **hdestroy()** is called.

The **hcreate\_r()**, **hdestroy\_r()**, and **hsearch\_r()** functions are re-entrant versions of the above functions that can operate on a table supplied by the user. The **hsearch\_r()** function returns 0 if the action is `ENTER` and the element cannot be created, 1 otherwise. If the element exists or can be created, it will be placed in *itemp*, otherwise *itemp* will be set to NULL.

## RETURN VALUES

The **hcreate()** and **hcreate\_r()** functions return 0 if the table creation failed and the global variable *errno* is set to indicate the error; otherwise, a non-zero value is returned.

The **hdestroy()** and **hdestroy\_r()** functions return no value.

The **hsearch()** and **hsearch\_r()** functions return a NULL pointer if either the *action* is `FIND` and the *item* could not be found or the *action* is `ENTER` and the table is full.

## EXAMPLES

The following example reads in strings followed by two numbers and stores them in a hash table, discarding duplicates. It then reads in strings and finds the matching entry in the hash table and prints it out.

```
#include <stdio.h>
#include <search.h>
#include <string.h>
#include <stdlib.h>

struct info { /* This is the info stored in the table */
    int age, room; /* other than the key. */
};

struct info *findentry(char *key, struct info *itemp);
```

```
#define NUM_EMPL          5000      /* # of elements in search table. */

int
main(void)
{
    char str[BUFSIZ]; /* Space to read string */
    struct info info_space[NUM_EMPL]; /* Space to store employee info. */
    struct info *info_ptr = info_space; /* Next space in info_space. */
    ENTRY item;
    ENTRY *found_item; /* Name to look for in table. */
    char name_to_find[30];
    int i = 0;

    /* Create table; no error checking is performed. */
    (void) hcreate(NUM_EMPL);

    while (scanf("%s%d%d", str, &info_ptr->age,
    &info_ptr->room) != EOF && i++ < NUM_EMPL) {
        /* Put information in structure, and structure in item. */
        item.key = strdup(str);
        item.data = info_ptr;
        info_ptr++;
        /* Put item into table. */
        (void) hsearch(item, ENTER);
    }

    /* Access table. */
    item.key = name_to_find;
    while (scanf("%s", item.key) != EOF) {
        if ((found_item = hsearch(item, FIND)) != NULL) {
            /* If item is in the table. */
            (void)printf("found %s, age = %d, room = %d\n",
            found_item->key,
            ((struct info *)found_item->data)->age,
            ((struct info *)found_item->data)->room);
        } else
            (void)printf("no such employee %s\n", name_to_find);
    }
    hdestroy();
    return 0;
}
```

{

## ERRORS

The **hcreate()**, **hcreate\_r()**, **hsearch()**, and **hsearch\_r()** functions will fail if:

[ENOMEM] Insufficient memory is available.

The **hsearch()** and **hsearch\_r()** functions will also fail if the action is FIND and the element is not found:

[ESRCH] The *item* given is not found.

## SEE ALSO

bsearch(3), lsearch(3), malloc(3), strcmp(3), tsearch(3)

## STANDARDS

The **hcreate()**, **hdestroy()**, and **hsearch()** functions conform to X/Open Portability Guide Issue 4, Version 2 ("XPG4.2").

## HISTORY

The **hcreate()**, **hdestroy()**, and **hsearch()** functions first appeared in AT&T System V UNIX. The **hcreate\_r()**, **hdestroy\_r()** and **hsearch\_r()** functions are GNU extensions.

## BUGS

The original, non-GNU interface permits the use of only one hash table at a time.
