

NAME

idn2_register_u8 - API function

SYNOPSIS

```
#include <idn2.h>
```

```
int idn2_register_u8(const uint8_t * ulabel, const uint8_t * alabel, uint8_t ** insertname, int flags);
```

ARGUMENTS

const uint8_t * ulabel
input zero-terminated UTF-8 and Unicode NFC string, or NULL.

const uint8_t * alabel
input zero-terminated ACE encoded string (xn--), or NULL.

uint8_t ** insertname
newly allocated output variable with name to register in DNS.

int flags optional **idn2_flags** to modify behaviour.

DESCRIPTION

Perform IDNA2008 register string conversion on domain label *ulabel* and *alabel*, as described in section 4 of RFC 5891. Note that the input *ulabel* must be encoded in UTF-8 and be in Unicode NFC form.

Pass **IDN2_NFC_INPUT** in *flags* to convert input *ulabel* to NFC form before further processing.

It is recommended to supply both *ulabel* and *alabel* for better error checking, but supplying just one of them will work. Passing in only *alabel* is better than only *ulabel*. See RFC 5891 section 4 for more information.

After version 0.11: *insertname* may be NULL to test conversion of *src* without allocating memory.

RETURNS

On successful conversion **IDN2_OK** is returned, when the given *ulabel* and *alabel* does not match each other **IDN2_UALABEL_MISMATCH** is returned, when either of the input labels are too long **IDN2_TOO_BIG_LABEL** is returned, when *alabel* does not appear to be a proper A-label **IDN2_INVALID_ALABEL** is returned, or another error code is returned.

REPORTING BUGS

Report bugs to <help-libidn@gnu.org>.
