

**NAME**

**ieee80211\_ddb** - 802.11 ddb support

**SYNOPSIS**

**options DDB**

**show vap [addr]**

**show all vaps**

**show com [addr]**

**show sta [addr]**

**show statab [addr]**

**show mesh [addr]**

**DESCRIPTION**

The **net80211** layer includes ddb(4) support for displaying important data structures. This is especially important because wireless applications are often built for embedded environments where cross-machine or post-mortem debugging facilities like kgdb(1) (*ports/devel/gdb*) are infeasible.

The most commonly used command is

```
show all vaps/a
```

which dumps the contents of all *ieee80211vap*, *ieee80211com*, and *ieee80211\_node* data structures in the system.
