NAME

iflibtxrx - Device Dependent Transmit and Receive Functions

SYNOPSIS

```
#include <ifdi_if.h>
```

```
Interface Manipulation Functions
```

```
int
isc_txd_encap(void *sc, if_pkt_info_t pi);

void
isc_txd_flush(void *sc, uint16_t qid, uint32_t _pidx_or_credits_);

int
isc_txd_credits_update(void *sc, uint16_t qid, bool clear);

int
isc_rxd_available(void *sc, uint16_t qsid, uint32_t cidx);

void
isc_rxd_refill(void *sc, uint16_t qsid, uint8_t flid, uint32_t pidx, uint64_t *paddrs, caddr_t *vaddrs, uint16_t count);

void
isc_rxd_flush(void *sc, uint16_t qsid, uint8_t flid, uint32_t pidx);

int
isc_rxd_pkt_get(void *sc, if_rxd_info_t ri);
```

Global Variables

extern struct if_txrx

DATA STRUCTURES

The device dependent mechanisms for handling packet transmit and receive are primarily defined by the functions named above. The if_pkt_info data structure contains statistics and identifying info necessary for packet transmission. While the data structure for packet receipt is the if_rxd_info structure.

The if_pkt_info Structure

The fields of *struct if_pkt_info* are as follows:

IFLIBTXTX(9) FreeBSD Kernel Developer's Manual IFLIBTXTX(9)

ipi_len	(uint32_t) Denotes the size of packet to be sent on the transmit queue.
ipi_segs	(bus_dma_segment_t *) A pointer to the bus_dma_segment of the device independent transfer queue defined in iflib.
ipi_qsidx	Unique index value assigned sequentially to each transmit queue. Used to reference the currently transmitting queue.
ipi_nsegs	(<i>uint16_t</i>) Number of descriptors to be read into the device dependent transfer descriptors.
ipi_ndescs	(<i>uint16_t</i>) Number of descriptors in use. Calculated by subtracting the old pidx value from the new pidx value.
ipi_flags	(uint16_t) Flags defined on a per packet basis.
ipi_pidx	(<i>uint32_t</i>) Value of first pidx sent to the isc_encap function for encapsulation and subsequent transmission.
ipi_new_pidx	(<i>uint32_t</i>) Value set after the termination of the isc_encap function. This value will become the first pidx sent to the isc-encap the next time that the function is called.

The Following Fields Are Used For Offload Handling

ipi_csum_flags		
		(uint64_t) Flags describing the checksum values, used on a per packet basis.
	ipi_tso_segsz	(uint16_t) Size of the TSO Segment Size.
	ipi_mflags	(uint16_t) Flags describing the operational parameters of the mbuf.
	ipi_vtag	(<i>uint16_t</i>) Contains the VLAN information in the Ethernet Frame.
	ipi_etype	(uint16_t) Type of ethernet header protocol as contained by the struct
	.pc.,p.c	ether vlan header.
		omor_, mil_nouder.
	ipi_ehrdlen	(<i>uint8_t</i>) Length of the Ethernet Header.
	ipi_enraien	(unito_i) Length of the Ethernet Header.
	11	(' (0)) Length of the TOD Headen
	ipi_ip_hlen	(uint8_t) Length of the TCP Header

ipi tcp hlen (uint8 t) Length of the TCP Header.

ipi_tcp_hflags

(*uint8_t*) Flags describing the operational parameters of the TCP Header.

ipi_ipproto (uint8_t) Specifies the type of IP Protocol in use. Example TCP, UDP, or SCTP.

The if_rxd_info Structure

The fields of *struct if_rxd_info* are as follows:

iri_qsidx (*uint16_t*) Unique index value assigned sequentially to each receive queue. Used

to reference the currently receiving queue.

iri_vtag (*uint16_t*) Contains the VLAN information in the Ethernet Frame.

iri_len (*uint16_t*) Denotes the size of a received packet.

iri_next_offset

(uint16_t) Denotes the offset value for the next packet to be receive. A Null value

signifies the end of packet.

iri_cidx (*uint32_t*) Denotes the index value of the packet currently being processed in the

consumer queue.

iri_flowid (*uint32_t*) Value of the RSS hash for the packet.

iri_flags (uint)

Flags describing the operational parameters of the mbuf contained in the

receive packet.

iri_csum_flags

(*uint32_t*) Flags describing the checksum value contained in the receive packet.

iri_csum_data (*uint32_t*) Checksum data contained in the mbuf(9) packet header.

iri_m (struct mbuf *) A mbuf for drivers that manage their own receive queues.

iri_ifp (struct ifnet *) A link back to the interface structure. Utilized by drivers that have

multiple interface per softc.

iri rsstype (*uint8 t*) The value of the RSS hash type.

iri_pad (*uint8_t*) The length of any padding contained by the received data.

 iri_qidx (uint8_t) Represents the type of queue event. If value >= 0 then it is the freelist id

otherwise it is a completion queue event.

FUNCTIONS

All function calls are associated exclusively with either packet transmission or receipt. The void *sc passed as the first argument to all of the following functions represents the driver's softc.

Transmit Packet Functions

isc_txd_encap()

Transmit function that sends a packet on an interface. The if_pkt_info data structure contains data information fields describing the packet. This function returns 0 if successful, otherwise an error value is returned.

isc_txd_flush()

Flush function is called immediately after the isc_txd_encap function transmits a packet. It updates the hardware producer index or increments the descriptors used to pidx_or_credits in the queue designated by the qid number. This is often referred to as poking the doorbell register.

isc_txd_credits_update()

Credit function advances the buffer ring and calculates the credits (descriptors) processed. Until the I/O is complete it cleans the range in case of multisegments and updates the count of processed packets. The function returns the number of processed credits.

Receive Packet Functions

isc_rxd_available()

Function calculates the remaining number of descriptors from a position given by idx. The function returns this value.

isc_rxd_refill()

Starting with the physical address paddrs, the function reads a packet into the rx_ring until a value designated by count is reached. vaddrs is typically not needed and is provided for devices that place their own metadata in the packet header.

isc_rxd_flush()

Flush function updates the producer pointer on the free list flid in queue set number qid to pidx to reflect the presence of new buffers.

isc_rxd_pkt_get()

Process a single software descriptor. rxr->rx_base[i] contains a descriptor that describes a received packet. Hardware specific information about the buffer referred to by ri is returned in the data structure if_rxd_info
