DESCRIPTION

The **`ldap_modrdn()`** and **`ldap_modrdn_s()`** routines perform an LDAP modify RDN operation. They both take *dn*, the DN of the entry whose RDN is to be changed, and *newrdn*, the new RDN to give the entry. The old RDN of the entry is never kept as an attribute of the entry. **`ldap_modrdn()`** is asynchronous, returning the message id of the operation it initiates. **`ldap_modrdn_s()`** is synchronous, returning the LDAP error code indicating the success or failure of the operation. Use of these routines is deprecated. Use the versions described below instead.

The **`ldap_modrdn2()`** and **`ldap_modrdn2_s()`** routines also perform an LDAP modify RDN operation, taking the same parameters as above. In addition, they both take the *deleteoldrdn* parameter which is used as a boolean value to indicate whether the old RDN values should be deleted from the entry or

not.

ERRORS

The synchronous (*_s*) versions of these routines return an LDAP error code, either `LDAP_SUCCESS` or an error if there was trouble. The asynchronous versions return -1 in case of trouble, setting the `ld_errno` field of *ld*. See `ldap_error(3)` for more details.
