NAME

    libssh2_keepalive_config - short function description

SYNOPSIS

    #include <libssh2.h>

    void
    libssh2_keepalive_config(LIBSSH2_SESSION *session,
                int want_reply,
                unsigned interval);

DESCRIPTION

    Set how often keepalive messages should be sent. **want_reply** indicates whether the keepalive messages should request a response from the server. **interval** is number of seconds that can pass without any I/O, use 0 (the default) to disable keepalives. To avoid some busy-loop corner-cases, if you specify an interval of 1 it will be treated as 2.

    Note that non-blocking applications are responsible for sending the keepalive messages using **libssh2_keepalive_send(3)**.

RETURN VALUE

    Nothing

AVAILABILITY

    Added in libssh2 1.2.5
