

NAME

mount_udf - mount a UDF file system

SYNOPSIS

mount_udf [-v] [-o *options*] [-C *charset*] *special node*

DESCRIPTION

The **mount_udf** utility attaches the UDF file system residing on the device *special* to the global file system namespace at the location indicated by *node*.

The options are as follows:

- o Options are specified with a **-o** flag followed by a comma separated string of options. See the mount(8) man page for possible options and their meanings. The following UDF specific options are available:
- v Be verbose about mounting the UDF file system.
- C *charset*
Specify local *charset* to convert Unicode file names.

SEE ALSO

cdcontrol(1), mount(2), unmount(2), fstab(5), mount(8)

HISTORY

The **mount_udf** utility first appeared in FreeBSD 5.0.
