

Name

mysql_thread_end - Releases thread specific memory

Synopsis

```
#include <mysql.h>
```

```
void mysql_thread_end(void );
```

Description

The `mysql_thread_end()` function needs to be called before a client thread ends. It will release thread specific memory, which was allocated by a previous **mysql_thread_init(3)** call. Returns void.

Notes

Unlike **mysql_thread_init(3)** `mysql_thread_end()` will not be invoked automatically if the thread ends. To avoid memory leaks `mysql_thread_end()` must be called explicitly.

History

This function is deprecated since MariaDB Connector/C 3.0.0.
