#### Name

mysql\_use\_result - returns an unbuffered result set

# **Synopsis**

```
#include <nysql.h>
MYSQL RES * mysql use result(MYSQL * mysql);
```

## **Description**

Used to initiate the retrieval of a result set from the last query executed using the mysql\_real\_query() function on the database connection. Either this or the **mysql\_store\_result(3)** function must be called before the results of a query can be retrieved, and one or the other must be called to prevent the next query on that database connection from failing.

### **Parameters**

• mysql is a connection identifier, which was previously allocated by mysql\_init(3) and connected by mysql\_real\_connect(3).

### **Notes**

The mysql\_use\_result() function does not transfer the entire result set. Hence several functions like mysql\_num\_rows(3) or mysql\_data\_seek(3) cannot be used. mysql\_use\_result() will block the current connection until all result sets are retrieved or result set was released by mysql\_free\_result(3).

### **Return value**

Returns an unbuffered result set or NULL if an error occurred.
