

NAME

openssl-rsautl - RSA command

SYNOPSIS

openssl rsautl [-help] [-in *file*] [-passin *arg*] [-rev] [-out *file*] [-inkey *filename|uri*] [-keyform DER|PEM|P12|ENGINE] [-pubin] [-certin] [-sign] [-verify] [-encrypt] [-decrypt] [-pkcs] [-x931] [-oaep] [-raw] [-hexdump] [-asn1parse] [-engine *id*] [-rand *files*] [-writerand *file*] [-provider *name*] [-provider-path *path*] [-propquery *propq*]

DESCRIPTION

This command has been deprecated. The **openssl-pkeyutl(1)** command should be used instead.

This command can be used to sign, verify, encrypt and decrypt data using the RSA algorithm.

OPTIONS**-help**

Print out a usage message.

-in *filename*

This specifies the input filename to read data from or standard input if this option is not specified.

-passin *arg*

The passphrase used in the output file. See **openssl-passphrase-options(1)**.

-rev Reverse the order of the input.

-out *filename*

Specifies the output filename to write to or standard output by default.

-inkey *filename|uri*

The input key, by default it should be an RSA private key.

-keyform DER|PEM|P12|ENGINE

The key format; unspecified by default. See **openssl-format-options(1)** for details.

-pubin

The input file is an RSA public key.

-certin

The input is a certificate containing an RSA public key.

-sign

Sign the input data and output the signed result. This requires an RSA private key.

-verify

Verify the input data and output the recovered data.

-encrypt

Encrypt the input data using an RSA public key.

-decrypt

Decrypt the input data using an RSA private key.

-pkcs, -oaep, -x931, -raw

The padding to use: PKCS#1 v1.5 (the default), PKCS#1 OAEP, ANSI X9.31, or no padding, respectively. For signatures, only **-pkcs** and **-raw** can be used.

-hexdump

Hex dump the output data.

-asn1parse

Parse the ASN.1 output data, this is useful when combined with the **-verify** option.

-engine *id*

See "Engine Options" in **openssl(1)**. This option is deprecated.

-rand *files*, -writerand *file*

See "Random State Options" in **openssl(1)** for details.

-provider *name***-provider-path *path*****-propquery *propq***

See "Provider Options" in **openssl(1)**, **provider(7)**, and **property(7)**.

NOTES

Since this command uses the RSA algorithm directly, it can only be used to sign or verify small pieces of data.

EXAMPLES

Examples equivalent to these can be found in the documentation for the non-deprecated **openssl-pkeyutl(1)** command.

Sign some data using a private key:

```
openssl rsautl -sign -in file -inkey key.pem -out sig
```

Recover the signed data

```
openssl rsautl -verify -in sig -inkey key.pem
```

Examine the raw signed data:

```
openssl rsautl -verify -in sig -inkey key.pem -raw -hexdump
```

```
0000 - 00 01 ff ff ff ff ff ff ff ff ff ff ff ff ff .....
0010 - ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff .....
0020 - ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff .....
0030 - ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff .....
0040 - ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff .....
0050 - ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff .....
0060 - ff ff ff ff ff ff ff ff ff ff ff ff ff ff ff .....
0070 - ff ff ff ff 00 68 65 6c-6c 6f 20 77 6f 72 6c 64 .....hello world
```

The PKCS#1 block formatting is evident from this. If this was done using `encrypt` and `decrypt` the block would have been of type 2 (the second byte) and random padding data visible instead of the 0xff bytes.

It is possible to analyse the signature of certificates using this command in conjunction with **openssl-asn1parse(1)**. Consider the self signed example in *certs/pca-cert.pem*. Running **openssl-asn1parse(1)** as follows yields:

```
openssl asn1parse -in pca-cert.pem
```

```
0:d=0 hl=4 l= 742 cons: SEQUENCE
4:d=1 hl=4 l= 591 cons: SEQUENCE
8:d=2 hl=2 l=  3 cons: cont [ 0 ]
10:d=3 hl=2 l=  1 prim:  INTEGER       :02
13:d=2 hl=2 l=  1 prim:  INTEGER       :00
16:d=2 hl=2 l= 13 cons:  SEQUENCE
18:d=3 hl=2 l=  9 prim:  OBJECT        :md5WithRSAEncryption
29:d=3 hl=2 l=  0 prim:  NULL
31:d=2 hl=2 l= 92 cons:  SEQUENCE
```

```

33:d=3 hl=2 l= 11 cons: SET
35:d=4 hl=2 l= 9 cons: SEQUENCE
37:d=5 hl=2 l= 3 prim: OBJECT      :countryName
42:d=5 hl=2 l= 2 prim: PRINTABLESTRING :AU
....
599:d=1 hl=2 l= 13 cons: SEQUENCE
601:d=2 hl=2 l= 9 prim: OBJECT      :md5WithRSAEncryption
612:d=2 hl=2 l= 0 prim: NULL
614:d=1 hl=3 l= 129 prim: BIT STRING

```

The final BIT STRING contains the actual signature. It can be extracted with:

```
openssl asn1parse -in pca-cert.pem -out sig -noout -strparse 614
```

The certificate public key can be extracted with:

```
openssl x509 -in test/testx509.pem -pubkey -noout >pubkey.pem
```

The signature can be analysed with:

```
openssl rsautil -in sig -verify -asn1parse -inkey pubkey.pem -pubin
```

```

0:d=0 hl=2 l= 32 cons: SEQUENCE
2:d=1 hl=2 l= 12 cons: SEQUENCE
4:d=2 hl=2 l= 8 prim: OBJECT      :md5
14:d=2 hl=2 l= 0 prim: NULL
16:d=1 hl=2 l= 16 prim: OCTET STRING
0000 - f3 46 9e aa 1a 4a 73 c9-37 ea 93 00 48 25 08 b5 .F...Js.7...H%..

```

This is the parsed version of an ASN1 DigestInfo structure. It can be seen that the digest used was md5.

The actual part of the certificate that was signed can be extracted with:

```
openssl asn1parse -in pca-cert.pem -out tbs -noout -strparse 4
```

and its digest computed with:

```
openssl md5 -c tbs
MD5(tbs)= f3:46:9e:aa:1a:4a:73:c9:37:ea:93:00:48:25:08:b5
```

which it can be seen agrees with the recovered value above.
