

NAME

PCRE2 - Perl-compatible regular expressions (revised API)

SYNOPSIS

```
#include <pcre2.h>
```

```
pcre2_general_context *pcre2_general_context_copy(  
pcre2_general_context *gcontext);
```

DESCRIPTION

This function makes a new copy of a general context, using the memory allocation functions in the context, if set, to get the necessary memory. Otherwise **malloc()** is used. The result is NULL if the memory cannot be obtained.

There is a complete description of the PCRE2 native API in the **pcre2api** page and a description of the POSIX API in the **pcre2posix** page.
