NAME

pfilctl - pfil(9) control utility

SYNOPSIS

pfilctl heads
pfilctl hooks
pfilctl link <**-i** | **-o**> [**-a**] *hook head*
pfilctl unlink <**-i** | **-o**> *hook head*

DESCRIPTION

The **pfilctl** utility is intended to view and change configuration of the pfil(9) packet filtering hooks and filters on them.

COMMANDS

heads   List available packet filtering points.

hooks   List available packet filters.

link <**-i** | **-o**> [**-a**] *hook head*

Link *hook* to *head*. With the **-i** flag the hook will be connected as input and with **-o** as output hook. At least one of **-i** or **-o** is required. By default **pfilctl** will prepend the hook in front of other hooks if any present: new hook will be as close to the wire as possible, so that on input it will be the first filter and on output it will be the last. Adding the **-a** flag switches to appending new hook instead of prepending.

unlink <**-i** | **-o**> *hook head*

Unlink *hook* on *head*. At least one of **-i** or **-o** is required. With the **-i** flag the hook will be removed from the input list of hooks and with **-o** on output list.
