

NAME

pom - display the phase of the moon

SYNOPSIS

pom [-p] [-d *yyyy.mm.dd*] [-t *hh:mm:ss*]

DESCRIPTION

The **pom** utility displays the current phase of the moon. Useful for selecting software completion target dates and predicting managerial behavior.

Use the **-p** option to print just the phase as a percentage.

Use the arguments **-d** and **-t** to specify a specific date and time for which the phase of the moon has to be calculated. If **-d** but not **-t** has been specified, it will calculate the phase of the moon on that day at midnight.
