NAME

rdma_get_recv_comp - retrieves a completed receive request.

SYNOPSIS

#include <rdma/rdma_verbs.h>

int rdma_get_recv_comp (struct rdma_cm_id **id***, struct ibv_wc ****wc***);**

ARGUMENTS

id   A reference to a communication identifier to check for completions.

wc   A reference to a work completion structure to fill in.

DESCRIPTION

Retrieves a completed work request for a receive operation. Information about the completed request
is returned through the wc parameter, with the wr_id set to the context of the request. For details on
the work completion structure, see ibv_poll_cq.

RETURN VALUE

Returns the number of returned completions (0 or 1) on success, or -1 on error. If an error occurs,
errno will be set to indicate the failure reason.

NOTES

This calls polls the receive completion queue associated with an rdma_cm_id. If a completion is not
found, the call blocks until a request completes. This call should only be used on rdma_cm_id's that
do not share CQs with other rdma_cm_id's, and maintain separate CQs for sends and receive
completions.
