

NAME

registervm, **unregistervm** - register/unregister a Java VM

SYNOPSIS

registervm */path/to/java*

unregistervm */path/to/java*

DESCRIPTION

The **registervm** and **unregistervm** utilities allow a Java VM to be registered and unregistered as a possible Java VM that **javavm** can use. The registration process places the registered VM in the Java VM wrapper configuration file in sorted order. When unregistering the Java VM is removed from the Java VM wrapper configuration file and will no longer be a possible choice for **javavm**.

FILES

/usr/local/etc/javavms

The location of the Java VM wrapper configuration file.

EXAMPLES

/usr/local/bin/registervm /usr/local/openjdk11/bin/java

Register */usr/local/openjdk11/bin/java* as a possible choice of Java VM for **javavm**.

/usr/local/bin/unregistervm /usr/local/openjdk11/bin/java

Remove */usr/local/openjdk11/bin/java* as a possible choice of Java VM for **javavm**.

SEE ALSO

checkvms(1), *javavm(1)*, *javavms(5)*

BUGS

The **registervm** and **unregistervm** utilities remove both blank lines and purely comment lines from the Java VM wrapper configuration file.
