

NAME

sasl_getconfpath_t - Cyrus SASL documentation

SYNOPSIS

```
#include <sasl/sasl.h>
```

```
int sasl_getconfpath_t(void *context, char ** path);
```

DESCRIPTION

```
int sasl_getconfpath_t(void *context, char **path);
```

sasl_getconfpath_t() is used if the application wishes to use a different location for the SASL configuration files. If this callback is not used SASL will either use the location in the environment variable SASL_CONF_PATH (provided we are not SUID or SGID) or */etc/sasl2* by default.

RETURN VALUE

SASL callback functions should return SASL return codes. See *sasl.h* for a complete list. **SASL_OK** indicates success.

Other return codes indicate errors and should be handled.
