

**NAME**

**vfs\_mountedfrom** - sets the mounted from name for a mount

**SYNOPSIS**

```
#include <sys/param.h>
```

```
#include <sys/mount.h>
```

*void*

```
vfs_mountedfrom(struct mount *mp, const char *from);
```

**DESCRIPTION**

The **vfs\_mountedfrom()** function sets the mounted from name for a mount. This value is used by **statfs(2)** to fill in *f\_mntfromname*.

In most cases *from* is the device that contains the file system, but in the case of a pseudo file system it could be a descriptive name like "devfs" or "procfs".
